# 1. NAVIGATION MENU

## 1.1. NAVIGATION MENU

### KEY

- \* QUICKSTART parameter > 501 - EEV = 1
- A EXTERNAL DRIVER parameter > 740 - EEV = 1.2

## 2. INTRODUCTION

The **EWCM EO** instrument range is made up of controllers dedicated to controlling the compressor rack of a refrigeration system, with simple, multistage or variable power compressors.

### 2.1. MAIN FEATURES

- Assembly on DIN bar
- Energy Saving Algorithms
- Pre-defined applications available
- Direct load connection
- Easy retrofit of both Eliwell instruments and those made by others
- Compatibility of sub-critical CO<sub>2</sub> systems with V910 plug&play driver
- Compatibility of HFO refrigerants
- Compressor Racks managed using glycol
- Rapid configuration tool for PC DeviceManager

### 2.2. DESCRIPTION

#### Features

- up to 19 completely configurable relay outputs for controlling simple, multistage or various power compressors and condenser fans
- up to 3 analogue outputs for controlling compressor INVERTERS and fan INVERTERS
- up to 3 inputs with pressure transducers for the compressor and fan sections
- 4 temperature inputs for NTC/NTC extended range /PTC probes also configurable as clean contact digital inputs
- up to 14 digital voltage inputs and up to 6 configurable clean contact digital inputs<sup>[1]</sup>
- Compatibility with a vast range of refrigerants
- Built-in clock (RTC)

#### Functions

- INVERTER control for compressors and fans
- Digital control in case of INVERTER error for compressors and fans, selectable by parameter
- Proportional control, PID and Dead band
- Selection of equal (homogeneous) power compressors switch-on and fan rotation policies
- Energy Saving Algorithms
- Two programmable Setpoints: 'normal' rate and 'reduced' rate.
- Dynamic setpoint on suction and discharge
- Time band management
- Management of probe alarms and minimum and maximum pressure switch alarms both for the compressor and fan sections
- Full alarm handling (self-diagnostic and alarms log)
- Operational log handling
- Upload/download parameters, alarms log, operational logs and glossaries with USB Copy Card
- Safety System that, in case of an EWCM failure, activates an alarm output to divert the control of the refrigerating unit to an emergency plant that assures minimal operations until experienced personnel step in.

1 see 'CONFIGURATION TABLE' page 115

---

### **Navigation and programming**

- User-friendly LCD graphic keyboard
- Menu navigation
- Quick access menu for immediate plant status display and setting main operating parameters
- Display and setting of programmable parameters in Bar, PSI, °C or °F
- 2 levels of access to programming parameters
- Quick Start Menu for quick and easy configuration
- Activation functions from keyboard

### **Telecontrol**

- Connections for TelevisSystem or Modbus RTU

All machine status configuration and control operations can be done with the LCD keyboard supplied. Menu navigation is user-friendly: two navigation languages (English + local language) are available as standard, defined according to the product code.

Device configuration and maintenance is protected by several password levels which hide/protect access for authorised persons only.

The Administrator Menu is for the system Administrator and allows access to the Quick Start Menu and all use and configuration parameters. The Administrator will also manage access passwords for users and expert users (installers and technicians).

The Quick Start Menu is dedicated to initial configuration of the machine/system and permits quick, efficient assignment of system resources.

The Service Menu is typically intended for use by the Administrator and Technical Service and allows use of the Copy Card (see appropriate chapter) and utilities diagnostics and control.

Using the 'function' and navigation keys, any user can check system status, display alarms, activate functions, etc. without needing a password.

Using the Clocks and Time Frames Menu it is also possible to set date and time and, with a weekly calendar, manage correct use of the plant.

### 3. TECHNICAL SPECIFICATIONS

#### 3.1. TECHNICAL SPECIFICATIONS (EN 60730-2-9)

Classification:	electronic automatic control (not safety) device for incorporation
Mounting:	on DIN Rail.
Type of action:	1.B
Pollution class:	2
Material class:	IIla
Over-voltage category:	II
Ball test temperature:	75 °C
Nominal pulse voltage:	2500 V
Operating Temperature:	-5 ... +55 °C
Storage Temperature:	30 ... +85 °C
Power supply:	SMPS 100...240V~ ±10% 50/60 Hz
EWCM consumption:	20 W max
Fire resistance category:	D
Software class:	A
RTC battery life:	In a power failure, the clock battery will last 4 days.

#### 3.2. FURTHER INFORMATION

##### 3.2.1. INPUT CHARACTERISTICS

Analogue inputs are configurable in pairs

**8900 9100 9900**                      **8900 9100 9900**    **PB1/PB2:**    4...20 mA / 0...10 V / 0...5 V

	- - <b>9900</b>	<b>OUT18 :</b>	1 relay SPST : 5(2) A max. 250 V~
	- - <b>9900</b>	<b>OUT19 :</b>	1 relay SPST : 5(2) A max. 250 V~

#### Analogue Outputs

<b>8900 9100 9900</b>	<b>8900 9100 9900</b>	<b>I1/V1:</b>	1 voltage/current
	<b>8900 9100 9900</b>	<b>I2/V2:</b>	1 voltage/current
<b>9900</b>	- - <b>9900</b>	<b>I3/V3:</b>	1 voltage/current

### 3.2.3. MECHANICAL CHARACTERISTICS

Casing:	PC+ABS resin casing, UL94 V-0
EWCM measurements:	Model 8900 / 9100 13 DIN Rail • Model 9900 18 DIN Rail
EWCM KEYBOARD measurements:	160x96x10 mm (Lxhxd)
Terminals:	removable for cables with cross-section of 2.5 mm <sup>2</sup>
Connectors:	removable type, pitch 5.08 for 90° insertion
EWCM KEYBOARD connector:	microfit 6-way quick connector, length 3 m max. distance base-keyboard 3 m
Humidity:	Operation / Storage: 10...90% RH (non-condensing)

### 3.2.4. STANDARDS

Electromagnetic compatibility:	The device complies with Directive 2004/108/EC
Safety:	The device complies with Directive 2006/95/EC

NB. The technical specifications stated in this document regarding measurement (range, accuracy, resolution, etc.) refer to the instrument alone and not to any accessories provided, such as probes. This means, for example, that the error introduced by the probe must be added to the characteristic instrument error.

### 3.2.5. ELECTRICAL CONNECTION PRECAUTIONS

**IMPORTANT! Make sure the appliance is switched off before working on the electrical connections. All operations must be carried out by qualified personnel.**

To ensure proper connections, comply with the following:

- Power supplies other than those specified can seriously damage the system.
- Use cables of suitable section for the terminals used.
- Separate (as much as possible) the cables of probes and digital inputs from inductive loads and power connections to prevent electromagnetic interference. Do not place the probe cables near other electrical equipment (switches, meters, etc.).
- Make connections as short as possible and do not wind them around electrically connected parts. Use shielded cables for the probe connections.
- To avoid causing static discharges, do not touch the electronic components on the boards.

For all electrical connections, refer to the wiring diagrams provided.

The device is equipped with extractable screw terminals to connect electric cables with a cross-section of 2.5 mm<sup>2</sup> (one wire per terminal for power connections).

The relay outputs are voltage free.

Do not exceed the maximum permitted current; for higher loads, use a contactor with sufficient power capacity.

Make certain the power supply voltage matches the rated voltage of the device.

Probes have no connection polarity and can be extended using a normal bipolar cable (note that the extension of the probes influences the instrument's EMC electromagnetic compatibility: take great care with the wiring). The pressure probes have an insertion polarity which must be observed.

### SUPERVISION

- connection to TelevisSystem / Modbus RTU remote management systems → through direct RS-485 assisted by an RS485/TTL-RS232 PCInterface converter and suitable software Licence.
  - connection to rapid DeviceManager → parameter programming software through BusAdapter and DMI
- For the installation of the RS-485 network, refer to the documentation provided.

### USB Copy Card

Fit the USB Copy Card TTL side into the slot and up/download the parameters as described in the specific chapter.

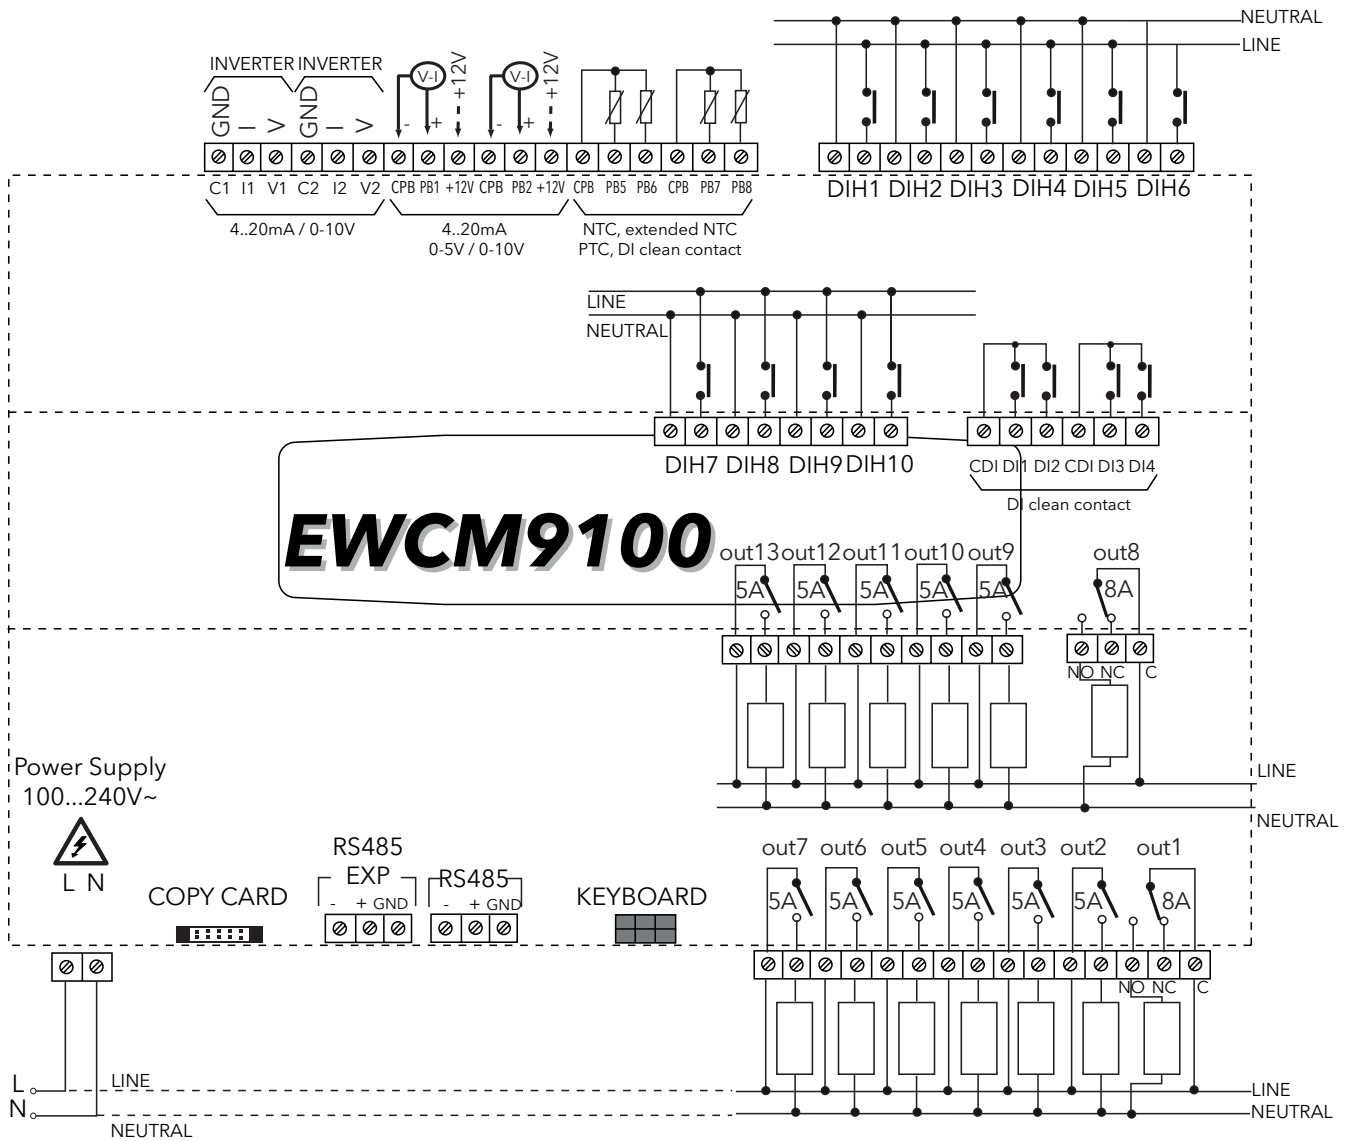

### 3.3. CONNECTIONS

#### 3.3.1. EWCM8900 TERMINALS

### 3.3.2. EWCM9100 TERMINALS

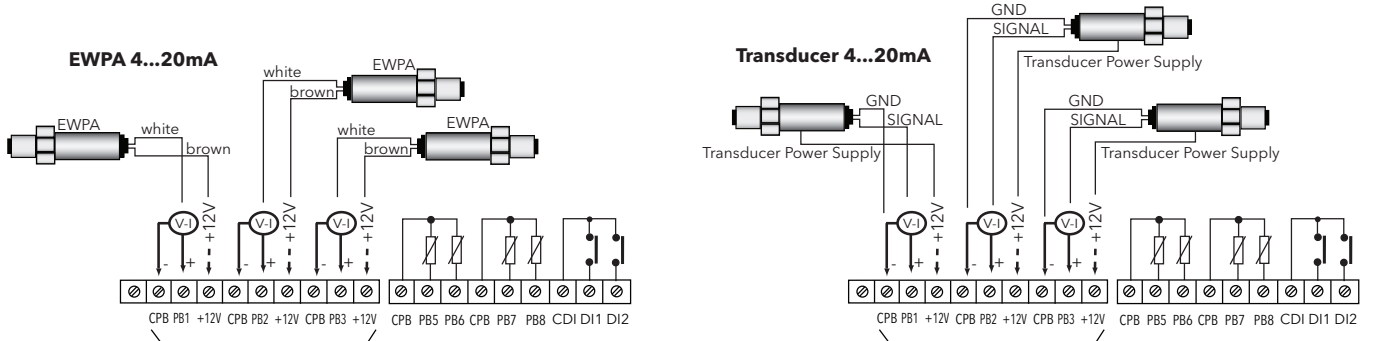

### 3.3.3. EWCM990 TERMINALS

### 3.4. I/O AND SERIAL

#### ANALOGUE INPUTS

#### ANALOGUE OUTPUTS

#### RS485 SERIAL PORTS

### 3.5. DIMENSIONS

Do not install the device in places subject to high humidity and/or dirt; it is intended for use in sites with ordinary or normal levels of pollution. Keep the area around the device cooling slots adequately ventilated.

## 3.6. MECHANICAL ASSEMBLY

### 3.6.1. POWER BOARD MOUNTING

To install the BASE on DIN RAIL, proceed as follows:

Move the four spring docking devices to their standby position (use a screwdriver levering on specific spaces).

Install the 'BASE' on the DIN RAIL, then press the 'spring docking devices' which will go to the closing position.

N.B.: With the 'BASE' assembled on the DIN RAIL, the 'Spring docking devices' must be turned downwards.

#### DIN RAIL

#### DIN RAIL

#### DIN RAIL

### 3.7. BASE-KEYBOARD CONNECTION

For the connection between the base and the keyboard, use the 3 m 6-wire microfit cable supplied. Only use the cable supplied, respecting the maximum distance of 3m. The cable must be wired separately from the power cables.

#### 3.7.1. DIMENSIONS AND MOUNTING THE KEYBOARD

The keyboard is designed for panel-mounting.

Make a 138x68mm hole.

Remove the front panel (figure 1) and make 6 holes in the panel that will hold the panel (figure 2) points A/B/C/D/E/F of dia. 2.7 mm at the specified spacing (figure 2). Insert the device, fixing it with the screws. Then press with fingers to close the front of the keyboard.

## 3.8. RS485 SERIAL PORTS

EWCM has two RS485 serial ports

- **RS485** for connection with the Televis/Modbus supervision system or fast programming of DeviceManager parameters
- **RS485 EXP** with connection with V910 driver for electronic expansion valve or of third parties  
**RS485 EXP** is set by default as **Modbus Slave**  
**RS485 EXP** can be set as **Modbus MASTER if 740 - EEvE > 0 and valve enabling relay is not present**

Folder	Parameter	Description	
EXTERNAL DRIVER	740 - EEvE >0	Enable electronic valve driver	=1,2
RESOURCE ALLOCATION Digital Outputs	584-H201 ÷ 602-H219	Control EEV activation from LP plant	value ≠ ±98

### 3.8.1. DEVICE MANAGER

Through the RS485 serial port, the Device Manager software is used to simplify and aid in installing and managing EWCM

#### Main Device Manager characteristics

- Device parameters management.

All basic components required to use the DeviceManager with EWCM are described below.

#### Device Manager Software component

The software application has a graphic user interface, described in the DeviceManager manual.

The Device Manager software supports both Eliwell/Modbus protocols.

The functions available to the customer depend on which Device Manager hardware interface has been purchased.

#### Device Manager Interface component (DMI)

The USB/TTL hardware interface, used in association with the software package, enables:

- Use of the software itself.
- Connection to device/s to control it/them.

There can be three different types of interface, corresponding to three user levels:

- DMI 100-1 END USER.
- DMI 100-2 SERVICE.
- DMI 100-3 MANUFACTURER.

Depending on the type purchased, the client has access or not to the functions described above

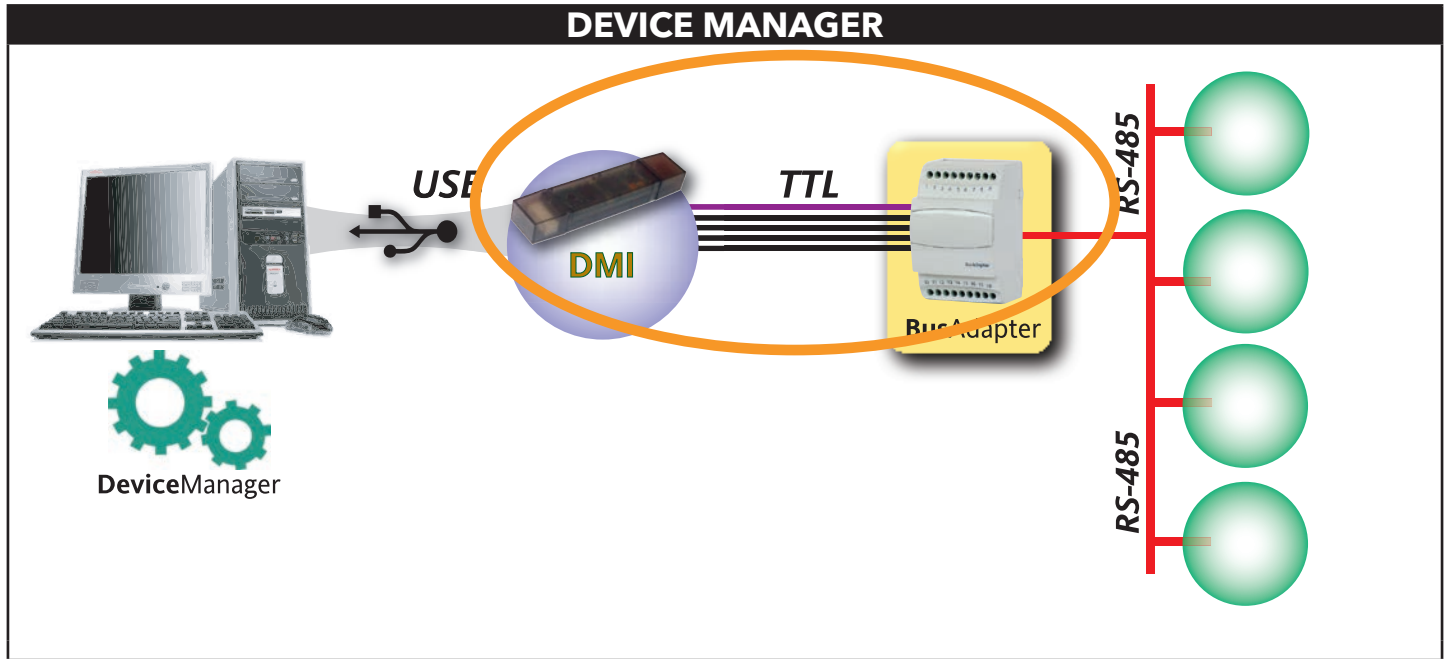

## BusAdapter Component

RS485-TTL Converter

The cable must be wired separately from the power cables.

**Components NEEDED: BUS ADAPTER + DMI + purple cable**

USE THE TTL PURPLE CABLE >

## 3.8.2. SUPERVISION

## 4. USER INTERFACE AND MACHINE STATUS

### 4.1. LED

Icon	Led	Operation	Meaning
((•)) ●	<b>Alarm</b>	●	alarm active (at least one)
		☀	alarm acknowledgement

		○	Main menu
● \$	<b>Economy Function</b>	●	Economy function on
		☀	forcing setpoint
		○	Economy function off

## 4.2. KEYS

	Main Display		Navigation menu	Write mode (Edit Mode)
key				
<b>F1</b>	Menu Compressors/Fans	-	-	-
<b>F2</b>	Access set/band menu	-	-	-
<b>F3</b>	Alarm acknowledgement	<ul style="list-style-type: none"> <li>Alarms menu</li> <li>Upload Glossaries (from reset)</li> </ul>	-	-
	-	-	Scrolls through menu options	Increases value
	Display discharge value [°C → bar] → [°F → PSI]	Probes menu	Access next menu	Saves and confirms value
	-	Navigation Menu	<ul style="list-style-type: none"> <li>Next menu</li> <li>Write mode</li> <li>Activates function</li> </ul>	Saves and confirms value
	-	-	Scrolls through menu options	Decreases value
	Display suction value [°C → bar] → [°F → PSI]	-	Goes back to previous menu	Exits write mode

## 4.3. KEYBOARD LOCK

When keyboard is locked the icon is displayed

EWCM foresees that keyboard operations can be disabled to prevent it being used accidentally. As soon as it is locked, the keys are disabled immediately.

**Keyboard lock: executed from parameter**

**DISPLAY > 549 - LoCK**

Keyboard lock It locks the keyboard disabling the following functions: modify parameters, modify Setpoints, resets operating hours of the various compressors and maintenance; 0 (No); 1 (Yes).

As soon as it is locked display returns to the main display automatically

**Unlock: from key, in main display**

To unlock the keyboard, hold down **F2** (default).

From parameter **DISPLAY > 550-HKUnL** you can choose which key to be used to unlock the keyboard. See table:

<b>550-HKUnL = 0</b>	aucune touche		
<b>550-HKUnL = 1</b>	<b>F1</b>	<b>550-HKUnL = 7</b>	<b>F1</b> 3sec
<b>550-HKUnL = 2</b>	<b>F2</b>	<b>default</b>	<b>F2</b> 3sec
<b>550-HKUnL = 3</b>	<b>F3</b>	<b>550-HKUnL = 8</b>	<b>F2</b> 3sec
<b>550-HKUnL = 4</b>		<b>550-HKUnL = 9</b>	<b>F3</b> 3sec
<b>550-HKUnL = 5</b>		<b>550-HKUnL = 10</b>	3sec
<b>550-HKUnL = 6</b>		<b>550-HKUnL = 11</b>	3sec
		<b>550-HKUnL = 12</b>	3sec

## 4.4. MAIN DISPLAY

The icons described are only visible in the Main Display. They are not present during Menu navigation.

The display is used to monitor the parameters, machine status and operating modes, as well as configuring machine parameters.

The Main Menu has 5 sections

A	Access to menus		B	DIGITAL Compressors/Fans
	F1	Displays Compressors/Fans		<b>Compressors</b> and number of compressors on
	F2	if keyboard locked		<b>Compressor power steps on</b> and number of compressors on
	F3	Displays Alarms		<b>Digital fans</b> and number of digital fans on

C	Suction	D	Discharge
	<ul style="list-style-type: none"> <li>the first number indicates the value read by the suction probe</li> <li>the second number indicates the value of the suction setpoint</li> </ul>		<ul style="list-style-type: none"> <li>the first number indicates the value read by the discharge probe</li> <li>the second number indicates the value of the discharge setpoint</li> </ul>
E	Compressor INVERTER	E	Fan INVERTER
	INVERTER output use percentage		INVERTER output use percentage

the percentage is only indicated by the number %: the icon does not identify power supplied, that is it is the same for all percentages.

### 4.4.1. COMPRESSOR/FAN STATUS

	F1	<b>Suction circuit 1</b> 	<b>Digital fans - discharge</b> 
		<b>Circuit 2 and mixed suction</b> 	<b>Fan INVERTER discharge</b> 

### 4.4.2. DISPLAYING PROBE VALUES

The Probes Menu only allows you to view the analogue input values.

For configuration see Parameters > Configuration.

You access the Probes Menu via the Main Display by pressing and holding down the RH (right-hand) function key.

This Menu displays the values of pressure transducers and probes in the plant.

#### Display probe values

To scroll through probe values press the 'UP' or 'DOWN' arrow keys.

Note that each input has two separate values.

**PB1 Pb2 Pb3 > Bar and PSI**  
**PB5 Pb6 Pb7 Pb8 > °C and °F**

NOTE: The value displayed is read-only and cannot be modified.

## Pressure transducers

PROBE	01/05	PROBE	02/05
PB1	13.4 Bar	PB2	3.61 PSI
PB1	13.4 PSI	PB3	13.4 Bar
PB2	3.61 Bar	PB3	13.4 PSI

## Temperature probes

PROBE	03/05	PROBE	04/05
PB5	15.6 °C	PB6	Err
PB5	32.4 °F	PB7	Err
PB6	Err	PB7	Err

### 4.4.3. MODIFY SET AND BAND

This Menu display the values of

- suction/discharge SetPoints
- suction bands
- discharge bands.

Access to the SET/BAND Menu takes place via the Main Display by pressing function key F2.

Main display → key F2	→															
<table border="1"> <thead> <tr> <th>SET</th> <th>01/02</th> </tr> </thead> <tbody> <tr> <td>Suc Set</td> <td>0.09 Bar</td> </tr> <tr> <td>Suc Band</td> <td>0.25 Bar</td> </tr> <tr> <td>Del Set</td> <td>14.4 Bar</td> </tr> </tbody> </table>	SET	01/02	Suc Set	0.09 Bar	Suc Band	0.25 Bar	Del Set	14.4 Bar	 <b>or OK</b>	<table border="1"> <thead> <tr> <th>SUC SET</th> <th>001/001</th> </tr> </thead> <tbody> <tr> <td>143 - SEt</td> <td>Suction setpoint</td> </tr> <tr> <td></td> <td>0.09 Bar</td> </tr> </tbody> </table>	SUC SET	001/001	143 - SEt	Suction setpoint		0.09 Bar

DEL BAND	001/001															
344 - Pbd	Proportional band															
	0.09 Bar															

### Example Modify set

For example, the suction setpoint is 0.09 bar.

To modify it go to the **Set Asp** item and press the key   
 The relative parameter **143 - SEt** appears

NOTES:

**RELATIVE PRESSURE SET > ABSOLUTE PRESSURE - 1bar.** In the example, 0.09 bar = (1.09 - 1 bar)

**ABSOLUTE PRESSURE SET > set via 543-rELP**

**MEASUREMENTÀ UNIT > depends on 548-UMFn**

**CENTRAL/LATERAL SET > based on 551-Stty** (same for both circuits)

#### 4.4.4. UNIT OF MEASUREMENT

##### Regulation

Temperature/pressure regulation is defined by the parameters

**DISPLAY > 547 - UMCP** → regulates suction By default: 0= °C; 1=bar;

**DISPLAY > 548 - UMFn** → regulates discharge By default: 0= °C; 1=bar;

There are another 2 parameters available defining regulation display range

**DISPLAY > 545 - UMMin** → Minimum suction measurement unit

**DISPLAY > 546 - UMMax** → Maximum suction measurement unit

By default: **545 - UMMin = 0** and **546 - UMMax = 1** → 0= °C; 1=bar

To consent regulation and display in °F / PSI:

if you set **545 - UMMin = 2** and **546 - UMMax = 3** → 2= °F; 3= PSI

**DISPLAY > 547 - UMCP** → suction regulation by choice between 2= °F; 3= PSI

**DISPLAY > 548 - UMFn** → discharge regulation by choice between 2= °F; 3= PSI

##### Display

From display you can only modify display (it can only be regulated by parameter) using the UP and DOWN keys

Please note that regulation always remains in the UM defined by parameter  
On restarting EWCM display is aligned to the parameter value defined

## 5. ASSISTED CONFIGURATION

### 5.1. ASSISTED CONFIGURATION

EWCM EO facilitates the setting of initial compressor rack settings using assisted configuration (Quick Start) of parameters, from choice of plant to number and type of compressors and fans, enable errors etc. and automatically 'allocating' system resources.

Resources can be configured 'manually' by the user<sup>11</sup> through the parameters

**PARAMETERS MENU > INSTALLER > RESOURCES**  
**PARAMETERS MENU > INSTALLER > RESOURCE ALLOCATION**

Choice of type of refrigerant must always be manual from

**PARAMETER MENU > INSTALLER > RESOURCE ALLOCATION > 641 - FtyP**

Here below you will find a description of the various stages for a correct configuration.

## ACCESS TO ASSISTED CONFIGURATION QUICK START

**QUICK START MENU > INSTALLER > The operation must be done by qualified personnel!**

The Quick Start Menu can be used to modify the plant and define the structure of inputs/outputs.

The Quick Start Menu is visible from **PARAMETERS MENU > INSTALLER**

	<b>MENU</b> 02/02 Functions <b>Parameters</b>	<b>PARAMETERS</b> 01/01 User <b>Installer</b>	<b>INSTALLER</b> 
		<b>INSTALLER</b> 01/05 <b>Quick Start</b> Compressors Fans	<b>INSTALLER</b> 

<b>QUICK</b> 01/01 Enable No Parameters Manual YES	<b>QUICK</b> 01/01 <b>Enable</b> No Parameters Manual YES	OK	<b>QUICK</b> 01/01 <b>Enable</b> Yes Parameters Manual YES
	<b>QUICK</b> 01/01 Enable No Parameters <b>Manual</b> YES		<b>QUICK</b> 01/01 Enable No Parameters <b>Manual</b> No

1 See section '6. START-UP' page 39

## Enabling

The Quick Start parameters should be 'enabled' for writing to be able to be modified<sup>[2]</sup>:

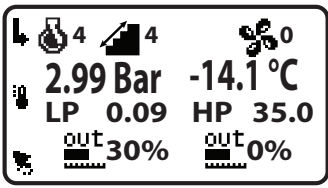

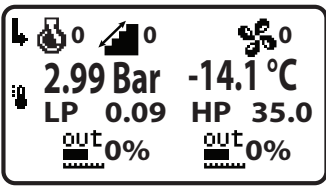

Position yourself on the 'UP' and 'DOWN' keys of the folder **Enable** and press 'OK' to enable modification. To disable parameter modification, repeat the procedure.

**Enable =No** > With this setting access to the Quick Start Parameters folder is read-only (parameters visible but not modifiable)

**Enable=Yes** > EWCM EO will behave as follows:

- all the outputs are deactivated (that is the machine doesn't adjust)
- the Functions Menu is disabled (only display)
- Manual resource assignment is disabled

From Main display note that with **Enable=Yes** the machine stops

Enable = No	Enable = Yes
	

Once you have exited the Quick Start menu, you must confirm the changed settings to make them operational

## Save new settings

Entering Quick Start to allow setting modification **Enable=No**→ **Yes**

Exiting Quick Start to confirm the modification **Enable=Yes**→ **No**

**Save new settings** > **Enable=Yes** → **No**

## Manual assignment of I/O resources

If the user wants to work on parameters and configure I/O manually it can access the relative folders

**PARAMETERS MENU** > **INSTALLER** > **RESOURCES**

**PARAMETERS MENU** > **INSTALLER** > **RESOURCE ALLOCATION**

On the contrary, it can use the function 'Manual':

**Manual=Yes** > leave this default setting if you do not want the and automatic I/O allocation

**Manual=No** > this setting **modifies the I/O allocation automatically**

On exiting the menu with **Save new settings** > **Enable=Yes** → **No** EWCM EO assigns inputs and outputs automatically associating settings just modified with physical resources.

<sup>2</sup> by default Quick Start parameters are NOT enabled for writing to prevent any unwanted configuration

### Quick Start parameters

Place yourself on the Parameters menu with 'UP' and 'DOWN' and press OK to display the Quick Start parameters themselves. Parameters are modified as described in the **Parameters** section

## CHOICE OF TYPE OF • COMPRESSORS • FANS PLANT

### PLANT • 501-TYPE

#### SUCTION

##### CIRCUITS

**1 CIRCUIT** > 501-TYPE = 0 or 501-TYPE = 2

**2 CIRCUITS** > 501-TYPE = 1

##### NUMBER OF COMPRESSORS

No. **number of compressors circuit 1** > 523-CPnU

No. **number of compressors circuit 2** > 525-CPnU2

No. of compressor circuits + 523+525 less than 12

No. of compressor circuits or circuit = 0 only in mixed case

**DISCHARGE PRESENCE • 520- Fnty ≠ 0**

##### NUMBER OF FANS

No. **number of fans** > 521-nFn

## CHOICE OF PLANT TYPE SUCTION 522- CtyP • 524- CtyP2

**CIRCUIT 1** > 522- CtyP

**CIRCUIT 2** > 524- CtyP2

0	<b>HOMOGENEOUS</b>	HOMOGENEOUS DIGITAL COMPRESSORS	
1	<b>NON HOMOGENEOUS</b>	NON-HOMOGENEOUS DIGITAL COMPRESSORS	
2	<b>HOMOGENEOUS + INVERTER</b>	- DIGITAL COMPRESSORS + INVERTER - just INVERTER → 523-CPnU = 0	If 523-CPnU = 0 then the section is just INVERTER without digital
3	<b>HOM+INV+ BACKUP</b>	DIGITAL COMPRESSORS + INVERTER with backup relay	See '17.1. SERVICE MENU' page 158

## CHOICE OF PLANT TYPE DISCHARGE 520- Fnty ≠ 0

0	<b>DISABLED</b>	discharge control disabled	
1	<b>INVERTER</b>	INVERTER	
2	<b>DIGITAL</b>	DIGITAL FANS	
3	<b>INVERTER + BACKUP</b>	INVERTER with backup relay	
4	<b>DIGITAL + INVERTER</b>	DIGITAL FANS + INVERTER	
5	<b>DIG + INV + BACKUP</b>	DIGITAL FANS + INVERTER with backup relay	See '17.1. SERVICE MENU' page 158

## COMPRESSOR STEPS AND POWER 502- PC1 • 513 - PC12

<b>STEPS o POWER COMPRESSORS</b>	<b>502-PC1</b>	Compressor 1 power or number of compressor 1 steps	1 ... 255	1	num
	<b>503-PC2</b>	Compressor 2 power or number of compressor 2 steps	1 ... 255	1	num
	<b>504-PC3</b>	Compressor 3 power or number of compressor 3 steps	1 ... 255	1	num
	<b>505-PC4</b>	Compressor 4 power or number of compressor 4 steps	1 ... 255	1	num
	<b>506-PC5</b>	Compressor 5 power or number of compressor 5 steps	1 ... 255	1	num
	<b>507-PC6</b>	Compressor 6 power or number of compressor 6 steps	1 ... 255	1	num
	<b>508-PC7</b>	Compressor 7 power or number of compressor 7 steps	1 ... 255	1	num
	<b>509-PC8</b>	Compressor 8 power or number of compressor 8 steps	1 ... 255	1	num
	<b>510-PC9</b>	Compressor 9 power or number of compressor 9 steps	1 ... 255	1	num
	<b>511-PC10</b>	Compressor 10 power or number of compressor 10 steps	1 ... 255	1	num
	<b>512-PC11</b>	Compressor 11 power or number of compressor 11 steps	1 ... 255	1	num
	<b>513-PC12</b>	Compressor 12 power or number of compressor 12 steps	1 ... 255	1	num

### EWCM EO Definitions:

Step equals use of a relay.

Step = Stages + 1

1 step → no stages (whole compressor)

2 steps → 1 stage

5 steps → 4 stages

If 522 - CtyP = 0 or 2 **502- PC1 • 513 - PC12** must be less than 6

Up to 12 compressors allowed in a plant.

Parameters **502- PC1 • 513 - PC12 Compressor power or number of compressor steps** establish:

**for HOMOGENEOUS compressors:** number of compressor steps

**for NON HOMOGENEOUS compressors:** value proportional to power

HOMOGENEOUS	HOMOGENEOUS	NON HOMOGENEOUS
<b>502 - PC1 = 1</b>	<b>502 - PC1 = 1</b>	<b>502 - PC1 = 50 (e.g 50% of power)</b>
<b>503 - PC2 = 2</b>	<b>503 - PC2 = 1</b>	<b>503 - PC2 = 30 (e.g 30% of power)</b>
<b>504 - PC3 = 3</b>	<b>504 - PC3 = 1</b>	<b>504 - PC3 = 20 (e.g 20% of power)</b>
<b>522-CtyP = 0 homogeneous</b>	<b>522-CtyP = 0 homogeneous</b>	<b>522-CtyP = 1 NON homogeneous</b>
<b>523-CPnU = 3</b>	<b>523-CPnU = 3</b>	<b>523-CPnU = 3</b>

$$\text{sum steps/compressor power} \rightarrow \sum 502-PC1 + 503-PC2 + 504-PC3$$

## ENABLING ALARMS

By default the cumulative alarm relay output is enabled

The generic alarm digital input is optional

<b>Digital output Cumulative Alarm 514-EAAL</b>	<b>Digital input Generic alarm 519-EAgA optional</b>
digital output: ±09	digital input: ±01

<b>Digital output INVERTER</b>	<b>Digital Input Error INVERTER</b>
±18	±66

## AUTOMATIC I/O ASSIGNMENT RULES

As described above on exiting the menu with **Save new settings > Enable=Yes → No** EWCM EO assigns inputs and outputs **automatically** associating the modified settings with physical resources based on certain rules. Assign automatically modifies parameters in the folder **RESOURCE ALLOCATION**

They will be assigned automatically in the order

### RESOURCE ALLOCATION > Digital outputs → for Suction

**514-EAAL = 1 > OUT1 ALARM → 584 - H201 = 9:** cumulative alarms digital output

#### case 515-EACI = 0 > relays are associated to digital compressors

- **OUT2** Compressor 1 Switch on (in general **OUT<sub>n+1</sub>**, Compressor Switch-on **n**)

in the case of FULL COMPRESSORS:

- **OUT3** Compressor 2 Switch-on (in general **OUT<sub>n+1</sub>**, Compressor Switch-on **n**)
  - **OUT4** Compressor 3 Switch-on (in general **OUT<sub>n+2</sub>**, Compressor Switch-on **n+1**)
- etc

in the case of STAGED COMPRESSORS

- **OUT3** Switch on Stage 1 Compressor 1 (Switch on Compressor Stage 1 **n**)
  - **OUT4** Switch on Stage 2 Compressor 1 (Switch on Compressor Stage 2 **n**)
- etc

Examples: alarm relay + 3 full compressors (default EWCM9100) or 3 compressors with 3 steps or homogeneous + inverter

	FULL	STAGES	HOMOGENEOUS + INVERTER
<b>OUT1</b>	<b>584 - H201 = 9</b>	<b>584 - H201 = 9</b>	<b>584 - H201 = 9</b>
<b>OUT2</b>	<b>585 - H202 = 19</b>	<b>585 - H202 = 19</b>	<b>585 - H202 = 31</b>
<b>OUT3</b>	<b>586 - H203 = 20</b>	<b>586 - H203 = 33</b>	<b>586 - H203 = 19</b>
<b>OUT4</b>	<b>587 - H204 = 21</b>	<b>587 - H204 = 34</b>	<b>587 - H204 = 20</b>
<b>OUT5</b>	<b>Discharge</b>	<b>588 - H205 = 20</b>	<b>588 - H205 = 21</b>
<b>OUT6</b>		<b>589 - H206 = 38</b>	<b>Discharge</b>
<b>OUT7</b>		<b>590 - H207 = 39</b>	

#### case 515-EACI = 1 > OUT2 COMPRESSOR INVERTER → 585 - H202 = 31: Enable compressor INVERTER

In the homogeneous + inverter case resources are translated by a relay

**RESOURCE ALLOCATION > Digital outputs → for Discharge**

**case 516-EAFI = 0 > relays are associated to digital fans**

- **OUT4** Switch on Fan 1 (in general **OUT<sub>k</sub>**, Switch on Fan **k**)
  - **OUT5** Switch on Fan 2 (in general **OUT<sub>k+1</sub>**, Switch on Fan **k+1**)
  - **OUT6** Switch on Fan 3 (in general **OUT<sub>k+2</sub>**, Switch on Fan **k+2**)
- etc

Examples: 3 full fans with full or staged compressors

<b>OUT4</b>	<b>Suction</b>	<b>Suction</b>
<b>OUT5</b>	<b>588 - H205 = 10</b>	<b>Suction</b>
<b>OUT6</b>	<b>589 - H206 = 11</b>	<b>Suction</b>
<b>OUT7</b>	<b>590 - H207 = 12</b>	<b>Suction</b>
<b>OUT8</b>		<b>591 - H208 = 10</b>
<b>OUT9</b>		<b>592 - H209 = 11</b>
<b>OUT10</b>		<b>593 - H210 = 12</b>

**case 516-EAFI = 1 > OUT... FAN INVERTER** Enable fan INVERTER

Examples: 3 full fans with fan INVERTER with full compressors and compressor INVERTER

<b>EWCM 9100</b>	
<b>OUT5</b>	<b>Suction</b>
<b>OUT6</b>	<b>589 - H206 = 18</b>
<b>OUT7</b>	<b>590 - H207 = 10</b>
<b>OUT8</b>	<b>591 - H208 = 11</b>
<b>OUT9</b>	<b>592 - H209 = 12</b>

## RESOURCE ALLOCATION > Digital Inputs

The digital inputs are:

### > in high voltage

- DIH1 Compressor INVERTER shut-down
- DIH2 Compressor 1 shut-down (in general compressor shut-down **n**, compressor shut-down **n**)
- DIH3 Compressor 2 shut-down (in general compressor shut-down **n+1**, compressor shut-down **n+1**)

etc

- DIH... Fan INVERTER shut-down
- DIH... Digital fan thermal switch 1
- DIH... Digital fan thermal switch 2

etc

- DIH... suction pressure switch
- DIH... Discharge pressure switch

### > clean contact

**517-EACIE =1 > DI... ERROR** compressor INVERTER

**518-EAFIE =1 > DI... ERROR** fan INVERTER

**519-EAFIE =1 > DI... GENERIC ALARM**

## RESOURCE ALLOCATION > Analogue Outputs

They are assigned automatically in the order:

- Switch-on **compressor** INVERTER
- Switch on **fan** INVERTER

**ANALOGUE INPUTS ARE NOT ASSIGNED AUTOMATICALLY.**

See '6.3. I/O configuration' page 39

## CONFIGURATION ERROR

If there is a configuration error the alarm **Err Conf.** appears **IO**

### Errors resettable manually

- number of **digital outputs**: outputs set exceed those available
- number of **analogue outputs**: outputs set exceed those available
- number of **digital inputs** (in high voltage or clean contact): inputs set exceed those available

In these cases the Quick Start configuration can be **reset manually** with the command **Reset Alarms** in the Alarms Menu. Resetting means the I/O can be assigned manually.

### Errors not resettable manually

Further errors where the Quick Start configuration cannot be reset manually  
So the I/O has to be re-assigned.

## SUCTION

- case HOMOGENEOUS STEPS or NON HOMOGENEOUS STEPS at least one compressor must be present (at least one compressor per circuit)
- case HOMOGENEOUS STEPS or HOMOGENEOUS STEPS + compressor INVERTERS, the number of steps per compressor must be less than 6

The 'homogeneous + inverter' system is always with digital compressors **homogeneous** + INVERTER

HOMOGENEOUS	NON HOMOGENEOUS	HOMOGENEOUS + INVERTER	INVERTER
522- CtyP = 0 524 -CtyP2 = 0	522- CtyP = 1 524 -CtyP2 = 1	522- CtyP = 2 524 -CtyP2 = 2	522- CtyP = 2 524 -CtyP2 = 2
↓	↓	↓	↓
MAX 12	MAX 12	MAX 10 +2 INVERTER	MAX 2
{2} 523- CPnU ≠ 0 {2} 525- CPnU2 ≠ 0	{2} 523- CPnU ≠ 0 {2} 525- CPnU2 ≠ 0	6	

## SUCTION INVERTER BACKUP

522- CtyP = 3 524 -CtyP2 = 3
<b>DIGITAL COMPRESSORS + INVERTER</b>
<b>+BACKUP</b>
<b>Digital Input Error</b> <b>517- EACIE</b>

- case **hom+inv+backup** the compressor INVERTER thermal switch must be assigned to a digital input (**517 - EACIE = Yes**)

### DISCHARGE

DIGITAL FANS	DIGITAL FANS + INVERTER	INVERTER
520- Fnty = 2	520- Fnty = 4	520- Fnty = 1
↓ MAX 8	↓ MAX 7 +1 INVERTER	↓ MAX 1

### DISCHARGE **BACKUP INVERTER**

520- Fnty = 3 520- Fnty = 5
FAN INVERTER or (DIGITAL + INVERTER)  <b>+BACKUP</b>
Digital Input Error 518- EAFIE

- case **digital+backup dig+inv+backup** Control switches to digital fans so the fan INVERTER thermal switch must be assigned to a digital input (**518 - EAFIE = Yes**)

#### N.B

#### DROP IN VOLTAGE

If there is a drop in voltage during modification of the Quick Start parameters, when the device is restarted the new settings will be applied even if they were not completed and saved using the appropriate procedure

Pay special attention when modifying parameters

#### N.B

The operations described modify the type of plant and assignment of resources.

The modification affects the Resource Allocation parameters described in the Administrator Parameters section (parameters 584 - H201...633 - H503)

Check that the parameters have been correctly configured before proceeding. If in doubt contact Eliwell Technical Support

Please note that if no changes have been made to the QuickStart parameters the device will NOT assign resources automatically that is does NOT change the default I/O status of the EWCM

## 6. START-UP

### 6.1. REFRIGERANT SELECTION

#### CONFIGURATION > 641 - FtyP

Type of refrigerant used in the system.

The selection of the type of refrigerant is necessary for correct system operations.

**N.B 641 - FtyP must only be modified by qualified personnel!**

**The operation must be performed on first installation, when verifying and configuring the type of application and selecting the probes and pressure transducers**

NOTE: 641 - FtyP= 3 DEFAULT

#### EWCM EO MODELS

641 - FtyP		641 - FtyP		641 - FtyP	
0	R22	5	R507	10	R407A
1	R134a	6	R717	11	R407F

\* Factory settings

### 6.2. TYPE OF DISPLAY: ABSOLUTE OR RELATIVE PRESSURE

#### DISPLAY > 543- rELP

Relative pressure. Selects display in absolute or relative pressure.

- 0 = absolute;
- 1 = relative.

### 6.3. I/O CONFIGURATION

#### 6.3.1. CONFIGURATION OF TRANSDUCERS PB1 PB2 PB3

Configurable in pairs

**ALL MODELS**  
**EWCM 9900**

**PB1 PB2**  
**PB3**

**CONFIGURATION > 646-Pb12**  
**CONFIGURATION > 647-Pb34**

646-Pb12		647-Pb34	EWCM9900
0	4-20mA	0	4-20mA
1	0-5V	1	0-5V
2	0-10V	2	0-10V
-	-	3	D.I. Digital input

##### 6.3.1.1 Resolution of pressure transducers PB1 PB2

650-HPb1		651-HPb2	
0	No	0	No
1	Yes HIGH PRECISION	1	Yes HIGH PRECISION

**HIGH PRECISION → SUCTION hundredths of bar / tenths PSI**  
**HIGH PRECISION → DISCHARGE hundredths of bar / tenths PSI**

### 6.3.1.2 Analogue inputs calibration

#### PB1 AND PB2 CALIBRATION IS ALWAYS IN ABSOLUTE VALUES (ABSOLUTE BAR)

Analogue inputs calibration can be set from parameters in the table

Note that each parameter can be given a double calibration depending on the Unit of Measurement. The calibration is significant when analogue inputs are configured as Digital. In the parameters table, the parameter is repeated 4 times on 4 separate lines.

transducers			temperature probes			
PB1	PB2	EWCM9900 PB3	PB5	PB6	PB7	PB8
655-CALb1	656-CALb2	657-CALb3	660-CALPb5	661-CALPb6	661-CALPb7	660-CALPb8
bar	bar	-	-	-	-	-
PSI	PSI	-	-	-	-	-

°F	°F	°F	°F	°F	°F	°F

### 6.3.2. CONFIGURATION OF TEMPERATURE PROBES PB5 PB6 PB7 PB8

**CONFIGURATION > 648-Pb56**

**CONFIGURATION > 649-Pb78**

Configurable in pairs

648-Pb56		649-Pb78	
3	D.I. Digital input	3	D.I. Digital input
4	NTC 103 AT	4	NTC 103 AT
5	PTC KTY81	5	PTC KTY81
6	NTC NK103 C1R1	6	NTC NK103 C1R1

### 6.3.3. CONFIGURATION OF ANALOGUE OUTPUTS

**ALL MODELS**

**CONFIGURATION > 652-AoS1**

**ALL MODELS**

**CONFIGURATION > 653-AoS2**

**EWCM 9900**

**CONFIGURATION > 654-AoS3**

652-AoS1 653-AoS2 654-AoS3	0	voltage
	1	current

## 7. MANAGEMENT OF FILES AND SERIAL PORTS

### 7.1. USB COPY CARD

The USB Copy Card is an accessory enabling

- fast parameter programming
- Instrument upgrading
- updating glossaries from LCD keyboard<sup>[1]</sup>
- management of alarms history files, recordings, etc.

The USB Copy Card is equipped with a TTL connector to be connected to the TTL serial port of the EWCM and a USB connector which connects to the USB port of a PC

A LED on the USB Copy Card comes on to indicate status of the various operations

**Check you have inserted the USB Copy Card in the right slot correctly!**

**Note.** Once the map has been downloaded from the USB Copy Card to EWCM EO, when the USB Copy Card is extracted EWCM EO resets automatically

#### 7.1.1. COPY CARD MENU

##### SERVICE > Copy Card

The Copy Card Menu is accessible from the Service Menu<sup>[2]</sup>.  
Access to the Service Menu requires a Password.

	<table border="1"> <tr> <td>MENU</td> <td>01/02</td> </tr> <tr> <td>Diagnostics</td> <td></td> </tr> <tr> <td><b>Service</b></td> <td></td> </tr> <tr> <td>Clock and bands</td> <td></td> </tr> </table>		MENU	01/02	Diagnostics		<b>Service</b>		Clock and bands

<b>SERVI</b>																											

1 the keyboard has a bilingual, updatable glossary (English - local language)

2 The Service Menu is described in detail in '17. APPENDIX' page 158

Service Menu folder 02/03 is shown here:  
 move onto the Copy Card folder with the UP and DOWN keys and enter the desired folder with the OK key

SERVI	02/03
Copy Card	
IO Test	
IO State	

COPY	01/02
Download	
Upload Map	
Upload Glossaries	

COPY	02/02
Upload Alarm History	
Format CopyCard	

The Copy Card Menu has 5 items; access to each folder is as described above:

- **Download:** permits 'download' of varied information on EWCM EO
- **Upload:** permits 'upload' of varied information to USB Copy Card

There are 4 file types available to be uploaded/downloaded via USB Copy Card  
 File names are defined by 4 parameters:

### PARAMETERS > FILES SETUP

		parameter	file name (depending on model)	extension
PARAMETERS > FILES SETUP	parameter map	461 - dAtF	8900-01 9100-01 9900-01	.DAT
PARAMETERS > FILES SETUP	glossary	462 - dgLoF		.GLO
PARAMETERS > FILES SETUP	alarms history	460 - HISF		.HIS
PARAMETERS > FILES SETUP	recordings	459 -rECF		.REC

File names must contain maximum 8 uppercase CHARACTERS

If the name of the file or parameter contains just spaces, EWCM EO assigns an 8 UPPERCASE character name automatically as per table:

### FILES SETUP NAMES ASSIGNED AUTOMATICALLY

parameter	file name default (depending on model)	file name assigned by user space = <input type="checkbox"/>	file name assigned by EWCM
461 - dAtF	8900-01 9100-01 9900-01	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	PARAM.DAT
462 - dgLoF		<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	GLOSSARY.GLO
460 - HISF		<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	HISTORY.HIS
459 -rECF		<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	RECORD.REC

#### 7.1.1.1 Format CopyCard

Enables 'formatting' that is cancelling all USB CopyCard contents.  
 We advise performing this operation every time before an Upload<sup>[3]</sup>.

FORMAT	01/01
Operation:	
< Operation state >	
Format	

To format the USB key, press Format. The message that will appear will be:

#### <Operation state >

The state of the operation can be:

- No operation
  - Operation in progress (°)
  - Operation Terminated (operation terminated successfully).
- (°) N.B! wait: it can take a few minutes.

If the operation is not finished successfully an error message appears:

<sup>3</sup> if you do not format the USB Copy Card in Download files with name and extension errors could appear

## Error Messages

- Err [No CopyCard] -> the USB CopyCard is not present

### 7.1.1.2 Upload

The following 3 file types are available to upload on the USB Copy Card from Copy Card Menu<sup>4</sup>

To upload the file select **Upload** and press OK.

The message that will appear will be:

#### <Operation state >

The state of the operation can be:

- No operation
  - Operation in progress (°)
  - Operation Terminated (operation terminated successfully).
- (°) N.B! wait: it can take a few minutes.

If the operation is not finished successfully an error message appears:

## Error Messages

- Err [No CopyCard] - > the USB CopyCard is not present\*
- Err [Write File]

### 7.1.1.3 Upload Recordings

The Recordings Menu allows uploading of operating log records to the instrument.

The Recordings Menu is accessible via the Service Menu (see). Access to the Service Menu requires a Password. The Service Menu folder 01/03 is indicated above; move to the Recordings folder with UP and DOWN and enter the desired folder with OK. Move onto the Upload folder On Copy Card with the UP and DOWN keys and enter with OK

#### Operation state

The state of the operation can be

- No operation
  - Operation in progress (°)
  - Operation Terminated (operation terminated successfully).
- (°) N.B! wait: it can take a few minutes.

If the operation is not finished successfully an error message appears:

## Error Messages

- Err [No Copy Card] - > the USB Copy Card is not present\*
- Err [Write File]
- Err [No File]

<sup>4</sup> The Recordings file is kept in the Recordings Menu. Also see Service Menu described in detail in '13. APPENDIX 131' on page 40

### 7.1.1.4 Download

The Download allows you to 'download' varied file types - selecting Next and using the DX (right) key you scroll through the various files to be downloaded<sup>5</sup>

- FILE.DAT → parameters map or predefined programme<sup>6</sup>
- FILE.X8M → applications and menu descriptors

Once selected, to download the desired file use the UP and DOWN keys to move onto <Download> and press OK. At this stage, download starts:

#### <Operation state >

The state of the operation can be:

- No operation
  - Operation in progress (°)
  - Operation Terminated (operation terminated successfully).
- (°) N.B! wait: it can take a few minutes.

If the operation is not finished successfully an error message appears:  
or an error message can appear:

#### Error Messages

X8M	DAT	GLO
Err [Read File]	Err [Read File]	Err [Read File]
Err [No CopyCard]	Err [No CopyCard]	Err [No CopyCard]
	Err [File Incompat.]	Err [File Incompat.]
	Err [Write Data]	Err [Write Data]

#### N.B

- File names **.DAT** must contain maximum 8 uppercase CHARACTERS
- When the application and parameters map downloads is completed, the device reboots automatically.
- When the glossary download is completed
  - remove the USB Copy Card
  - remove EWCM EO keyboard cable
  - keep pressed F3 key on EWCM EO keyboard while connecting keyboard cable again.

Glossaries (available on base board) will be uploaded now also on EWCM EO keyboard automatically:

Following messages will appear:

```
Upload Glossary Req
Upload Glossary Run
Upload Glossary...
```

Operation will take a while. Please keep waiting until glossaries have been uploaded

- Navigation is not possible while the glossaries are downloading.
- files with **.DAT** extension are compatible with the **.DAT** format of Device Manager.
- If the USB CopyCard is already connected when the device boots, you can still download the application + menu descriptors (**.X8M**) from the USB Copy Card.

This must be a single file, present in the USB Copy Card main directory.

If the USB Copy Card contains two **.X8M** files (or no **.X8M** file) when the device boots, no download will be executed in the USB Copy Card.

For map files **.DAT** import can be done at boot time even in case of normal startup, under the same rules described above.

5 names given are by default - see description to modify them **PARAMETERS > FILES SETUP**  
6 for predefined programmes supplied by Eliwell see **APPENDIX APPLICATION BOOK**

## EXPORTING OPERATING LOGS TO THE USB COPY CARD

Exporting operating logs to the USB Copy Card can be done from the keyboard via the 'Service' Menu.

All data will be saved to a single text file with extension **.REC** in the following order:

- weekly records from the oldest to the most recent
- daily records.

NOTE: Data is stored daily and/or weekly at a preset time (time 23:00)

### Example of export

```
REC-REPORT
DD/MM/YY-HH:MM
MB_USERID1
MB_USERID2
-----
Desc      UM      Avg      Min      DD/MM/YY-HH:MM      DD/MM/YY-HH:MM

ALL       [Num]   xxxxxx
```

### Key

The field DD/MM7YY-HH:MM reported in the header indicates file upload date

MB\_USERID1 and MB\_USERID2 are 20 character strings set by the user through relative parameters

**PARAMETERS > FILES SETUP > 452 - USId1**

**PARAMETERS > FILES SETUP > 453 - USId2**

- HP indicates the refrigerant discharge pressure
- HT indicates the refrigerant discharge temperature
- LP1/2 indicates the circuit 1/2 refrigerant suction pressure
- LT1/2 indicates the circuit 1/2 refrigerant suction temperature
- HP indicates the power of the fans as a percentage
- TEXT indicates the external ambient temperature
- TINT indicates the internal ambient temperature
- LTSET1/2 indicates the circuit 1/2 suction temperature [°C]
- HTSET indicates the discharge circuit temperature [°C]
- LPSET1/2 indicates the circuit 1/2 suction pressure [bar]
- HPSET indicates the discharge circuit pressure [bar]

- LP1/2 indicates the power of the circuit 1/2 compressors as a percentage
- \*HPR indicates possible discharge pressure switch activation
- \*LPR1/2 indicates possible circuit 1/2 discharge pressure switch activation
- \*HPE indicates possible fan INVERTER error
- \*LPE1/2 indicates possible circuit 1/2 compressor INVERTER error
- \*AL indicates possible machine shut-down alarm

Note:

Temperature values are in tenths of °C

Discharge pressure values are in tenths of a bar

Suction pressure values are in hundredths of a bar

The column Avg contains the average value of the daily or weekly values.

The Min and Max columns contain the minimum and maximum values respectively.

\* The sum of the number of activations is reported (e.g. discharge pressure switch)

Note:

- in weekly recordings the two fields 'DD/MM/YY-HH:MM' represent the dates for the start and end of a week.
  - daily recordings have only one date.
  - To import the **.REC** text into Excel, we advise using the 'delimited' option with fields separated by 'Space'. Use the point as decimal separator and set the 2 'HH:MM' columns to text format.
- The log can be cancelled in the Service Menu.

### UPLOADING THE ALARMS HISTORY

All data will be saved to a single text file with extension **.HIS** in the following order:

```
HIS REPORT
DD/MM/YY HH:MM
USER ID 1
USER ID 2
-----
- 01 E0102-13-12/04/05-01
- 02 E0101-13-14/04/05-01
```

If the log contains no alarms the format will be as follows:

```
HIS REPORT
DD/MM/YY HH:MM
MB_USERID1
MB_USERID2
-----
EMPTY
```

### Key

DD/MM/YY HH:MM is the upload date

USER ID 1 and USER ID 2 are two 20 character strings set by the user in parameters

**PARAMETERS > FILES SETUP > 452 - USId1**

**PARAMETERS > FILES SETUP > 453 - USId2**

Note that alarms notified during upload to USB Copy Card export are ignored.

## 7.2. SERIAL PORTS

### 7.2.1. PROTOCOL SELECTION

**ADDRESSING > 673-PtStLV**

**ADDRESSING > 676 - PtSEXP**

Protocol selection **RS485**

RS485	RS485 EXP		Notes
673-PtStLV = 2	676 - PtSEXP = 2	Micronet (Televis)	
673-PtStLV = 3	676 - PtSEXP = 3	Modbus RTU	

### 7.2.2. TELEVIS NETWORK

**ADDRESSING > 671-FAA** Family address.

Permits family selection within the TelevisSystem network.

For example: 00 01 00=**671-FAA**; **672-dEA**

**ADDRESSING > 672-dEA** Device address.

Permits address selection within the TelevisSystem network. must be pre-set being careful that each pair is univocal (they do not have to be adjacent).

Addresses **671-FAA**; **672-dEA** are valid for the Televis

**N.B.:** we suggest assigning the same value as **671-FAA** to all devices in a sub-network to identify them more easily.

### 7.2.3. MODBUS NETWORK

RS485	RS485 EXP		Notes
674-bdrttLV	676 - PtSEXP		
674-bdrttLV = 0	676 - PtSEXP = 0	9600 baud	
674-bdrttLV = 1	676 - PtSEXP = 1	19200 baud	
674-bdrttLV = 2	676 - PtSEXP = 2	38400 baud	
675-PtytLV = 0	678 - PtyEXP = 0	NONE	679 - datEXP RS485 EXP data bit. 0=7 data bit; 1=8 data bit;
675-PtytLV = 1	678 - PtyEXP = 1	ODD	
675-PtytLV = 2	678 - PtyEXP = 2	EVEN	

## 8. FUNCTIONS

### 8.1. FUNCTIONS

This chapter describes the various function available with EWCM EO

Functions can be enabled in several modes (key, dedicated digital input<sup>[1]</sup>, etc.)

There is also a dedicated **FUNCTION MENU** where you enable/disable the function chosen manually on display<sup>[2]</sup>.

All functions can be enabled from **FUNCTION MENU**

		<b>MENU</b> 01/02 Diagnostics Service Clock and bands	<b>MENU</b> 02/02 <b>Functions</b> Parameters
		<b>FUNCT</b> 01/04 Mute No Suc. Eco No Cond. Eco. No	<b>FUNCT</b> 02/04 Aux1 No Aux2 No Aux3 No
		<b>FUNCT</b> 03/04 Glyc.Defr. No En.Saving No Recovery No	<b>FUNCT</b> 01/04 CtRitLq No SbGasCa No Stand-by No

#### 8.1.1. 'ENERGY SAVING' FUNCTION

The Energy Saving function manages all Economy functions in Suction (circuit 1 and 2) and Discharge.

##### Enabling

As the following table shows and based on parameter settings

##### FUNCTIONS > 556-ESFn

##### Energy saving type.

✓ economy function enabled;

black background: no variation

	Economy Discharge	Suction Economy circuit 1	Suction Economy circuit 2
0	disabled	disabled	disabled
1		✓	
2			✓
3		✓	✓
4	✓		
5	✓	✓	
6	✓		✓
7	✓	✓	✓

1 If the request originates from a digital input, the Energy Saving function will be enabled/disabled by changing digital input status (active with contact open).

2 Enabled in 'toggle' mode: indicates that the function is enabled if disabled and vice versa by using the same sequence of keys. Keystroke, Functions menu and remote requests enable/disable toggle the function.

The activation request may come from:

- FUNCTION MENU**
- TIME BANDS**
- DIGITAL INPUT > configure a digital input ±09**
- KEY**
- SUPERVISION**

N.B. If the heat recovery function is enabled and enabling the Energy Saving function results in a change in the state of the discharge Economy function, the recovery function is disabled.

Disabling occurs as per the exclusion table for disabling via time bands (°)

Energy Saving will be disabled also in the case in which the state is modified (for instance by key) of a function indicated in the table with 'economy function enabled' (✓).

Example: If Economy is disabled in discharge and **556-ESFn = 5** the Energy Saving function will be disabled in Circuit 1 Suction (besides Economy in discharge, naturally). Circuit 2 suction Economy will undergo no change.

N.B. The Energy saving LED will go out.

### (°) Time Bands

- If time band control is already active, the status specified for the current time band is forced when the time band itself starts.
- If, during a given time band, other requests come in from keystrokes, the function menu or remote controls, these are considered by the system.
- If disabled by time bands, the discharge and suction economy functions are determined by the time band settings  
Eg. if at 6.30 p.m. I access band 2 where the Energy Saving function is disabled, the discharge and suction Economy modes are determined by the respective settings in the band.

## 8.1.2. ECONOMY FUNCTION • SUCTION SET POINT

The Economy function manages the control of the regulation SetPoint

The function allows control to be obtained on the suction regulation SetPoint depending on the ambient temperature (for instance the temperature of the display area of the supermarket)

The activation request may come from:

- FUNCTION MENU**
- TIME BANDS**
- DIGITAL INPUT > configure a digital input ±06 (CIRCUIT 1) / ±07 (CIRCUIT 2)**
- KEY**
- SUPERVISION**
- ENERGY SAVING FUNCTION**

### Parameters

Folder			Description
COMPRESSORS Regulation/Alarms	107-dSS	207-dSS	Dynamic Suction Set Mode
COMPRESSORS Regulation Limits	146-dSPo1	246-dSPo1	Offset 1 for dynamic set Value to be summed to the Setpoint when the economy function in suction is activated by time bands just for weekdays and for all other modes (digital / key / menu / remote / energy saving)
COMPRESSORS Regulation Limits	147-dSPo2	247-dSPo2	Offset 2 for dynamic set Value to be summed to Setpoint when economy function in suction is activated by time bands just for holidays.
COMPRESSORS Regulation Limits	155 - AtdS	255 - AtdS	Ambient temperature dynamic set
COMPRESSORS Regulation Limits	156 - dAtdS	256 - dAtdS	AtdS differential

The Set can be fixed or variable (function of a differential) defined by:

**COMPRESSORS > Regulation/Alarms > 107 - dSS = 0**

→ suction SetPoint will be **dynamic** or function of a differential.

**COMPRESSORS > Regulation/Alarms > 107 - dSS = 1**

→ suction SetPoint **fixed**

Case **COMPRESSORS > Regulation/Alarms > 107 - dSS = 0** → **Dynamic Suction SetPoint**

**Enabling**

**107 - dSS = 0**

- 145 - AtdS Set dynamic Amb Tp
- 146 - dAtdS AtdS differential

If 146-dAtdS=0 the correction is equal to 136-dSPo1 (137 - dSPo2) for ambient temperature values < SET, for higher values there is no correction.

If the internal ambient temperature probe is in error or not configured, the function is not enabled and the correction is always =0

Case **COMPRESSORS > Regulation/Alarms > 107 - dSS = 1** → **Fixed Suction SetPoint**

- If the activation request is determined by a time band, the correction is added to the setpoint (fixed offset)
  - 136 - dSPo1 Offset 1 for Set dyn (24h /Mon-Fri / Mon-Sat) **WEEKDAYS**
  - 137 - dSPo2 Offset 2 for Set dyn (Sat-Sun/ Sun) **HOLIDAYS**
 according to the settings of the Time Band Mode
- In all other cases the correction (fixed offset) will be summed to the: 136 - dSPo1.

• If the request originates from the Energy Saving function, economy will be enabled/disabled by changing the status of the Energy Saving function. It will be enabled if the Energy saving function requires it, and disabled otherwise.

**(°) Time Bands**

- If time band control is already active, the status specified for the current time band is forced when the time band itself starts.
- If, during a given time band, other requests come in from keystrokes, the function menu or remote controls, these are considered by the system

### 8.1.3. ECONOMY FUNCTION • DISCHARGE SET POINT

The Economy function manages control of the regulation SetPoint

The function allows control on the discharge regulation SetPoint to be obtained depending on the external ambient temperature (for instance the temperature of the condenser).

The activation request may come from:

**FUNCTION MENU**

**TIME BANDS**

**DIGITAL INPUT > configure a digital input ±08**

**KEY**

**SUPERVISION**

**ENERGY SAVING FUNCTION**

#### Parameters

Folder	Parameter	Description
FANS Regulation/Alarms	<b>314-dSd</b>	Discharge economy function mode
FANS Regulation Limits	<b>349-dSFo</b>	This parameter has two meanings depending on <b>314-dSd</b> : <ul style="list-style-type: none"> <li>If 314-dSd=1 (fixed set) → Fixed offset for economy discharge function (value to be subtracted from discharge set point)</li> <li>If 314-dSd=0 (dynamic set) → Upper limit of dynamic set economy discharge (floating condensation) based on the sum <b>343-SEt + 349-dSFo</b></li> </ul>
FANS Regulation Limits	<b>356-dSdo</b>	Dynamic offset dynamic set economy discharge*
FANS Regulation Limits	<b>357-dSLdo</b>	Minimum economy discharge dynamic set offset (floating condensation)*
FANS Regulation Limits	<b>358-dSMEt</b>	Maximum external temp. to enable discharge economy dynamic set (floating condensation)*
FANS Regulation Limits	<b>359-LdSP</b>	Minimum economy discharge dynamic set (floating condensation)*
FANS Regulation Limits	<b>360-SCt1</b>	Minimum Sub-cooling (floating condensation dynamic set)*
FANS Regulation Limits	<b>361-SCt2</b>	Maximum Sub-cooling (floating condensation dynamic set)*
FANS Regulation Limits	<b>362-SCd1</b>	Sub-cooling* Delta 1
FANS Regulation Limits	<b>363-SCoF1</b>	Sub-cooling* Offset 1
FANS Regulation Limits	<b>364-SCd2</b>	Sub-cooling* Delta 2
FANS Regulation Limits	<b>365-SCoF2</b>	Sub-cooling* Offset 2
FANS Regulation Limits	<b>366-EtPr</b>	Disables dynamic setpoint if temperature measured by the sub-temperature probe is greater than the ext. ambient probe temperature + 366-EtPr. Note. If 366-EtPr = 0 function not enabled

The Set can be fixed or variable (function of a differential) defined by:

**FANS > Regulation/Alarms > 314 - dSd = 0**

→ discharge SetPoint will be **dynamic** (floating condensation) or function of a differential.

**FANS > Regulation/Alarms > 314 - dSd = 1**

→ discharge SetPoint **fixed**

Case **FANS > Regulation/Alarms > 314 - dSd = 0** → **Dynamic Discharge Set mode**

**Operating conditions**

External temperature is less than parameter **FANS > Regulation Limits > 358-dSMEt**

The condensation Setpoint is derived by summing the external temperature to the 'CR' factor, where:  
**356-dSdo** → Value to be summed to external temperature in proportion to plant power.

$$CR = 356-dSdo * \text{power \% delivered by the system} / 100$$

**Notes**

- The CR factor is limited below by the parameter **357-dSLdo** (minimum offset)

**Sub-cooling**

Sub-cooling is used to prevent liquid return to the condenser and prevent gas sub-cooling.

**Operating conditions**

Presence of sub-cooling probe

Sub-cooling UCtemp (see diagram) is calculated using the sub-temperature probe value, positioned upstream of the liquid receiver, and that of the discharge probe:

**temperature regulation**

$$UCtemp = \text{discharge gas temperature} - \text{sub-cooling probe}$$

**pressure regulation**

$$UCtemp = \text{value converted in temperature (Discharge gas pressure)} - \text{sub-cooling probe}$$

In accordance with the second diagram, a further correction is applied to the fluctuating setpoint (summed to the current setpoint).

**Note:**

- **360-Sct1** minimum sub-cooling (floating condensation dynamic set).
- **361-Sct1** maximum sub-cooling (floating condensation dynamic set)

• If  $360-Sct1 < UCtemp < 361-Sct2 \rightarrow$  no correction

• For external values  $\rightarrow$

correction **proportional**  $\rightarrow$  with divergences  $< 362-SCd1$  or  $364-SCd2$ .

correction **fixed**  $\rightarrow$  with divergences greater and equal to  $363-SCoF1$  or  $365-SCoF2$

After running the sub-cooling function following limitations will be applied (see chart on previous page):

- The **effective** value of the floating setpoint will be limited below by **359-LdSP** (areas A and B - see chart on previous page)
- The **effective** value of the floating setpoint is limited above so that it cannot take on higher values than the HIGH SET value (Area C - see chart on previous page):

**Upper limit of dynamic set economy discharge**

**HIGH SET = 343-SEt + 349-dSFo**

No correction is made to the setpoint if:

- the external temperature probe on the condenser is in error or not configured;
- the discharge probe is in error or not configured;
- the temperature measured by the sub-cooling probe is higher than the external temperature probe on the condenser + **366-EtPr (366-EtPr $\neq$ 0)**;

In these cases the set point set by parameter is used

Case **FANS > Regulation/Alarms > 314 - dSd = 1**  $\rightarrow$  **Fixed Discharge Set mode**

The following will be subtracted from set point value **349 - dSFo** that is Fixed offset for discharge economy function

- If the request originates from the Energy Saving function, economy will be enabled/disabled by changing the status of the Energy Saving function. It will be enabled if the Energy saving function requires it, and disabled otherwise.

### 8.1.4. LIQUID RETURN

Liquid return control is needed to check the quantity of refrigerant present in the system.

The liquid return function enables in duty cycle the solenoid valves in the relative refrigeration counters belonging to the same circuit

#### Operating conditions

**Safety Measures** > **565-odo** → time set expired

**QUICKSTART** → **Enable** = No

#### Activate

Activation with delay in relation to turning off the compressors defined by

**circuit 1 FUNCTIONS** > **559-LrCd**

**circuit 2 FUNCTIONS** > **562-LrCd2**

#### Parameters

Folder			Description
FUNCTIONS	<b>559-LrCd</b>		Circuit 1 control liquid return activation delay
FUNCTIONS	<b>560-Lron</b>		Circuit 1 control liquid return ON time duty cycle
FUNCTIONS	<b>561-LroF</b>		Circuit 1 control liquid return OFF time duty cycle
FUNCTIONS		<b>562-LrCd2</b>	Circuit 2 control liquid return activation delay
FUNCTIONS		<b>563-Lron2</b>	Circuit 2 control liquid return ON time duty cycle
FUNCTIONS		<b>564-LroF2</b>	Circuit 2 control liquid return OFF time duty cycle

The liquid return relay control is determined by 584 - H201 Relay OUT1, ..., 596 - H213 Relay OUT13 if at least one of these = 6

#### DUTY CYCLE circuit 1

**ON FUNCTIONS** > **560-Lron**

**OFF FUNCTIONS** > **561-LroF**

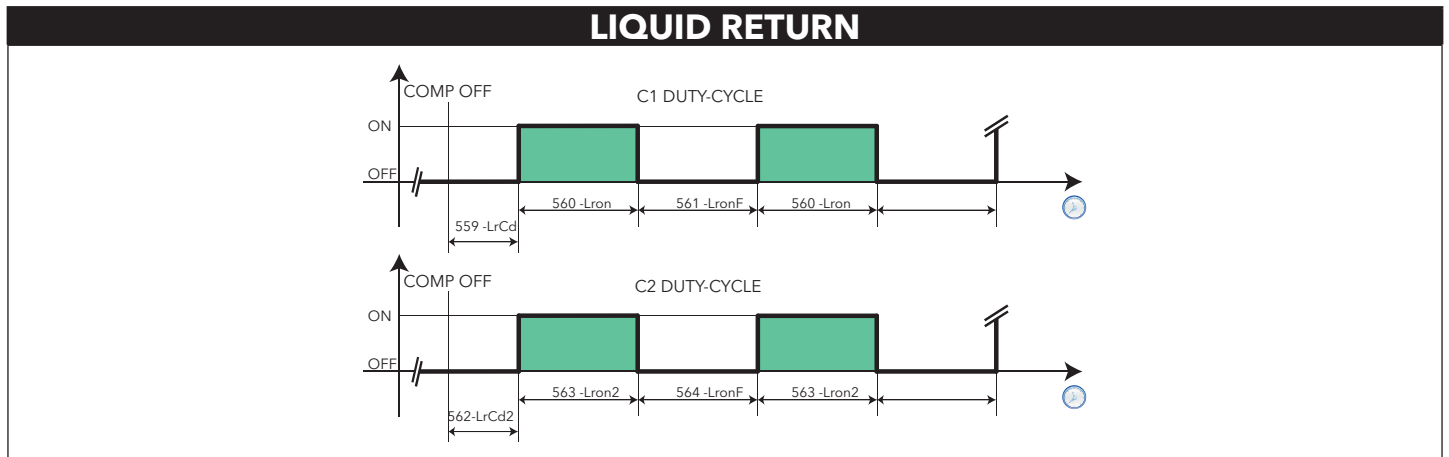

#### DUTY CYCLE circuit 2

**ON FUNCTIONS** > **562-Lron2**

**OFF FUNCTIONS** > **564-LroF2**

#### Function not active

If at least one of the compressors of the circuit where the function is on switches on, control will be deactivated.

**output always ACTIVE** > circuit 1 > **560-Lron non 0** & **561-LroF = 0**

**output always ACTIVE** > circuit 2 > **562-Lron2 non 0** & **564-LroF2 = 0**

**output always NOT ACTIVE** > circuit 1 > **560-Lron = 0** & **561-LroF non 0**

**output always NOT ACTIVE** > circuit 2 > **562-Lron2 = 0** & **564-LroF2 non 0**

**output always NOT ACTIVE** > circuit 1 > **560-Lron = 0** & **561-LroF = 0**

**output always NOT ACTIVE** > circuit 2 > **562-Lron2 = 0** & **564-LroF2 = 0**

		OUTPUT			OUTPUT
<b>560-Lron non-zero</b>	<b>561-LroF 0</b>	ACTIVE	<b>562-Lron2 non-zero</b>	<b>564-LroF2 0</b>	ACTIVE
<b>0</b>	<b>non-zero</b>	NOT ACTIVE	<b>0</b>	<b>non-zero</b>	NOT ACTIVE
<b>0</b>	<b>0</b>	NOT ACTIVE	<b>0</b>	<b>0</b>	NOT ACTIVE

### 8.1.5. HEAT RECOVERY

Heat recovery control is determined by parameters 627 - H405... 630 - H408 if at least one of these = 7 (recovery water temperature).

#### Operating conditions

The discharge Economy function will be deactivated if the recovery water temperature is less than **557 - Hrto**. The discharge Economy function returns to active in the current time band if the recovery water temperature is greater than **557-Hrto+558-Hrdt**

#### Parameters

Folder		Description
FUNCTIONS	<b>557-Hrto</b>	Max heat recovery outlet water temperature
FUNCTIONS	<b>558-Hrdt</b>	Delta heat recovery outlet water temperature

### HEAT RECOVERY ONLY FROM TIME BANDS

#### Function not active

- with a recovery probe failure.
- disabled when the discharge economy function status is modified.

### 8.1.6. AUXILIARY OUTPUT

Controls directly up to 3 digital auxiliary outputs. The (AUX) activation request may come from:

**FUNCTION MENU**

**TIME BANDS**

**DIGITAL INPUT > configure a digital input ±94**

**KEY**

**FUNCTIONS MENU**

**SUPERVISION**

Keystroke, Functions menu and remote requests toggle<sup>[3]</sup> (activate/de-activate) the function:

- If time band control is already active, the status specified for the current time band is forced when the time band itself starts.
- if other requests occur during the time band they are always considered.

#### Operating conditions

At device switch on

<sup>3</sup> Enabled in 'toggle' mode: indicates that the function is enabled if disabled and vice versa by using the same sequence of keys. Keystroke, Functions menu and remote requests enable/disable toggle the function.

### 8.1.7. HOT GAS DEFROST

#### Operating conditions

**Safety Measures** > **565-odo** → time set expired

#### Parameters

The parameters that control this regulator are:

Folder			Description
SAFETY MEASURES	<b>565-odo</b>		Regulation delay from power-on.
COMPRESSORS Regulation/Alarms	<b>109-PoPr</b>	<b>209-PoPr</b>	Power default for suction probe error or minimum power required in subcritical CO2 systems in cascade

When a hot gas defrost is required for a refrigerated counter (or set of counters) on a single circuit, the controller must have at least one compressor on the circuit in question which remains active during defrosting to ensure a production of gas.

On activation of the digital input configured as 'Hot Gas Defrosting Request' for a circuit, the compressors on the circuit are controlled so as to deliver a power equal, or as close as possible in excess, to the minimum power given by **109-PoPr**.

If the system is already delivering a power greater than **109-PoPr**, the situation remains unchanged

In particular, for systems with NON HOMOGENEOUS STEPS the system will attempt to guarantee a power as close as possible in excess relative to that requested, in line with the available resources at the time of the decision.

### 8.1.8. GLYCOL SYSTEMS

#### Operating conditions

**SAFETY MEASURES** > **565-odo** → time set expired

**QUICKSTART** → **Enable= No**

#### Activate

Activation with delay in relation to turning off the compressors defined by

**FUNCTION MENU**

**TIME BANDS**

**DIGITAL INPUT** > **configure a digital input ±94**

#### Parameters

The parameters that control this regulator are:

Folder	Parameter	Description
SAFETY MEASURES	<b>565-odo</b>	
FUNCTIONS	<b>750-toUtgLy</b>	Glycol system defrost time out

During defrosts, the power requested of compressors will be forced at 0%.

All other regulators will suffer no limits.

When defrost is over, regulation goes back to normal.

Start defrost events, with defrosting on cycle, are cancelled

Defrosting ends for time-out **SAFETY MEASURES** > **750-toUtgLy** minimum value 1 minute.

### 8.1.9. STAND BY

Stand by foresees that all regulators are switched off and alarms de-activated

#### Operating conditions

At device switch on

#### Activate

Activation with delay in relation to turning off the compressors defined by

#### FUNCTION MENU

**DIGITAL INPUT > configure a digital input ±97**

#### SUPERVISION

On stand by the display displays **OFF**

### 8.1.10. ALARM MUTE

Stand by foresees that all regulators are switched off and alarms de-activated

#### Operating conditions

At device switch on

#### Activate

#### FUNCTION MENU

**KEY > F3 (default)**

#### SUPERVISION

Alarms can be muted in the Main Display by pressing key F3 once (press and release) (see Keys and Components section)<sup>4</sup>. The alarm LED flashes.

The relay configured as an alarm relay will be deactivated.

#### Mute duration

parameter **SAFETY MEASURES > 568-Aro.**

If **SAFETY MEASURES > 568-Aro=0** mute is not enabled.

### 8.1.11. FORCING THE SUCTION AND DISCHARGE SETPOINT FROM DI

1. A suitably configured digital input can be used to force the discharge setpoint to the value **FANS > Regulation Limits > 342-HSE**. Forcing takes priority over all the functions that change the setpoint, and remains active as long as the digital input is active. If the function is active, the Economy LED blinks.
2. A suitably configured digital input can be used to force the suction setpoint to the value **COMPRESSORS > Regulation Limits > 141-LSE for circuit 1 and 241-LSE for circuit 2**. Forcing takes priority over all the functions that change the setpoint, and remains active as long as the digital input is active. If the function is active, the Economy LED blinks.

#### Operating conditions

At device switch on

#### Activate

**DIGITAL INPUT > configure a digital input ±98 (suction); ±99 (discharge)**

**ANALOGUE INPUT configured as DIGITAL > configure PB3 ±101 (suction); ±102 (discharge)**

**ANALOGUE INPUT configured as DIGITAL > configure PB5...8 ±108 (suction); ±109 (discharge)**

<sup>4</sup> operation in this case is not toggle. Mute cannot be 'de-activated' from the functions menu.

## 8.2. TIME BANDS

### Menu

The Clock and Time Bands Menu is used to set the date/time and the device's operational time bands.

### Operating Condition

#### CONFIGURATION > 640 - rtCE = 'YES' (RTC present)

On the contrary the correct display and the change of the date/time will not be guaranteed.

### Date and Time Menu

	<p>MENU 01/02 Diagnostics Service <b>Clock and bands</b></p>	<p>MENU 02/02 Functions Parameters</p>
	<p>DATE/ 01/01 Date and Time Time Bands</p>	
<p><b>Change Date</b> N.B.: The year is displayed as a two digit integer (2012 is displayed as 12, 2013 as 13)</p>	<p>DATE/ 01/01 09/07/12 09:04 <b>Change Date</b> Change Time</p>	<p>CHANG 01/01 DD 9 MM July YY 12</p>
<p><b>Change Time</b></p>	<p>DATE/ 01/01 09/07/12 09:04 Change Date <b>Change Time</b></p>	<p>CHANG 01/01 HH 9 hours MM 6 min</p>

Time is in the format HH:0...23: MM:0...59.

Resolution is to the minute.

**Leap years** > are considered. For example: February 2012 will have 29 days.

**CHANGE TIME** > solar to legal and vice versa **NOT managed**

### Parameters

The parameters concerned are:

Folder		Parameter	Description
COMPRESSORS Regulation Limits	<b>146-dSPo1</b>	<b>246-dSPo1</b>	Offset 1 for dynamic set Value to be summed to the Setpoint when the economy function in suction is activated by time bands just for weekdays and for all other modes (digital / key / menu / remote / energy saving)
COMPRESSORS Regulation Limits	<b>147-dSPo2</b>	<b>247-dSPo2</b>	Offset 2 for dynamic set Value to be summed to Setpoint when economy function in suction is activated by time bands just for holidays.
CONFIGURATION	<b>640-rtCE</b>	<b>640-rtCE</b>	Enable RTC. Yes (1) = RTC enabled; No (0) = RTC disabled. If 640-rtCE = No the Time Band Menu is NOT important
SAFETY MEASURES	<b>583-rtCAE</b>	<b>583-rtCAE</b>	RTC alarm

### Time Bands Menu

each week can be divided into 6 periods in which controls can be set, such as dynamic suction Setpoint, energy saving, and so on.

**Calendar** > **WEEKLY**: the week can also be divided into two periods (weekdays and holidays) with dedicated settings.

	<p>MENU 01/02</p> <p>Diagnostics Service <b>Clock and bands</b></p>	<p>MENU 02/02</p> <p>Functions Parameters</p>
	<p>DATE/ 01/01</p> <p>Date and Time <b>Time Bands</b></p>	
<p><b>Time Bands</b></p>	<p>TIME 01/01</p> <p>Enable No Mode weekly Settings</p>	<p>MODE 001/001</p> <p>Time Band mode  weekly</p>

### Enabling

Enter the Clock Menu and Bands and choose Time Bands

Enable appears. Enter in Edit Mode with OK or DX (right): change the value from No to Yes with UP. Confirm with OK; to exit press SX (left).

### TIME BAND MODE

Menu for selecting the method of using Time Bands

To enter and modify Mode, do as is described above.

The values are:

**= 0 (weekly).** The weekly mode (**24 H**) indicates that every day will have the same settings

**= 1 (Monday → Friday and Saturday → Sunday)** mode 1 indicates that Monday to Friday will have one setting and the weekend another

**= 2 (Monday → Saturday and Sunday)** Mode 2 requires Sunday to have a different setting to the rest of the week.

You can check the mode set from the Settings menu

### Settings

Menu for changing the parameters of each single band. To access and change the Time bands mode (Time Bands) proceed likewise as described above. The display is determined by what is set in the Mode Menu.

In the example, the Time bands mode is set to 1.

For each group of days it is possible to set 6 independent and separately enabled time bands.

For each band it is possible to enable or disable a function.

**BANDS > 6 BANDS MAX - 4H EACH**

**FUNCTIONS > 9 FUNCTIONS available**

Time	BAND 1	BAND 2	BAND 3	BAND 4	BAND 5	BAND 6
hours	0 hours	4 hours	8 hours	12 hours	16 hours	18 hours
minutes	0 min	0 min	0 min	0 min	0 min	0 min
FUNCTIONS	BAND 1	BAND 2	BAND 3	BAND 4	BAND 5	BAND 6
Suc. Dynamic Set 1	✓	✓	✓	✓	✓	✓
Suc. Dynamic Set 2	✓	✓	✓	✓	✓	✓
Discharge Dynamic Set	✓	✓	✓	✓	✓	✓
Auxiliary 1	✓	✓	✓	✓	✓	✓
Auxiliary 2	✓	✓	✓	✓	✓	✓
Auxiliary 3	✓	✓	✓	✓	✓	✓
Glycol defrosts	✓	✓	✓	✓	✓	✓
Energy Saving	✓	✓	✓	✓	✓	✓
Heat Recovery	✓	✓	✓	✓	✓	✓

### Clock not active

If the clock is not active (parameter 640 - rtCE =No) the date and time indicated will not be accurate. Whenever the machine is switched off and on again, the time will display as 00/00/00 00:00. Re-setting the parameter 640 - rtCE=Yes will return to the correct display. The clock has a buffer battery to prevent interruptions in power and/or blackouts.

### Clock error (RTC error)

If the battery is drained or the clock is faulty, an RTC error will be signalled by the Alarms Menu.

### Example

#### Mode = 1 (Monday→Friday and Saturday→Sunday)

We have selected mode 1 that is the division of the week into Monday->Friday and Saturday->Sunday. In the Settings menu, we access Mon-Fri

#### Days Mon-Fri

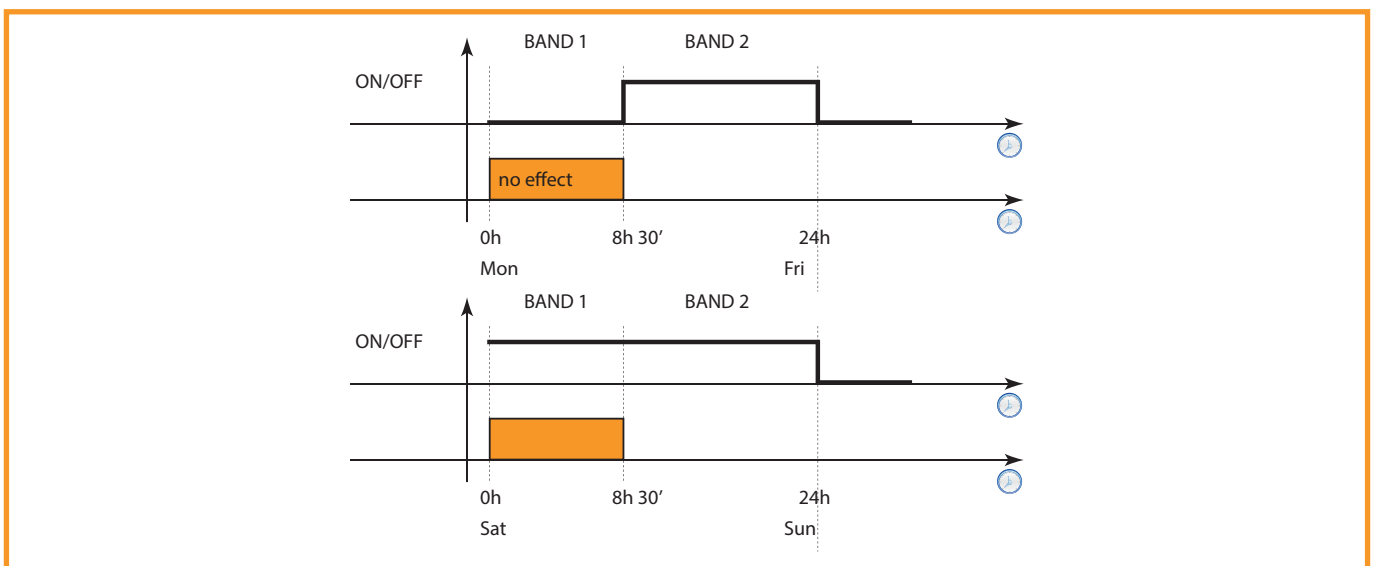

- If you consider the first band NOT active that is '**Band 1** →No'.
  - the start time is nonetheless determined by 'Band 1 hours' and 'Band 1 minutes' (default 0:00 i.e. midnight)
- If you consider the second band active that is '**Band 2** →Yes'.
- With 'Band 2 hours' we set the starting time in hours of time band 2 (e.g 8 hours)
- With 'Band 2 minutes' we set the starting time in minutes of time band 2 (e.g 30 minutes). Note that the settings for time Band 1 terminate when time band 2 starts
- Use 'Energy Saving No' to de-activate energy saving during time band 2.

#### Days Sat-Sun

- If you consider the first band active that is '**Band 1** →Yes'.
- We use 'Band 1 hours' and 'Band 1 minutes' to set the start of time band 1 as described above for Mon->Fri.
- We use 'Suc. Dynamic set 1' to enable the dynamic suction setpoint during time band 1.

Note:

- Time band duration goes from its starting time to the starting time of the next time band.
- The functions enabled for the time band are activated when the time band starts, the same applies to disabled functions.
- The status of the functions may be modified within the time band by:
  - dedicated digital input for the function in question;
  - key;
  - Functions Menu;
  - remote (supervision system or Web);
- if the parameter 'Band 1' is also enabled for the weekdays Mon-Fri ('Band 1 Yes') we have 2 offset controls on the setpoint for the weekdays and the weekend.
- if the Energy Saving function is enabled, the setpoint offset settings will be ignored
- if the Heat Recovery function is enabled the settings of the condensation setpoint offsets will be ignored

## 9. COMPRESSORS

### 9.1. COMPRESSORS

Parameters regulating compressors are visible in the folder and sub-folders

**PARAMETERS > COMPRESSOR**

### 9.2. TYPE SYSTEM SUCTION

With assisted configuration, in the Quick Start Menu, the suction section type must have been set through parameters

**QUICK START > 522- CtyP for circuit 1**

**QUICK START > 524- CtyP2 for circuit 2**

The three regulations can be selected from parameter **COMPRESSORS > Regulation/Alarms > 101-CCFn**

	Quick Start parameter 522- CtyP 524- CtyP2	Suction System Type	Regulation parameter 101-CCFn
0	<b>HOMOGENEOUS</b>	<b>HOMOGENEOUS DIGITAL COMPRESSORS</b>	<b>PID DEAD BAND PROPORTIONAL BAND</b>
1	<b>NON HOMOGENEOUS</b>	<b>NON-HOMOGENEOUS DIGITAL COMPRESSORS</b>	<b>DEAD BAND</b>
2	<b>HOMOGENEOUS + INVERTER</b>	<b>DIGITAL COMPRESSORS + INVERTER or just INVERTER (no. digital compressors circuit <math>\square</math> or circuit <math>\square</math> = 0)</b>	<b>PID DEAD BAND</b>
3	<b>HOM+INV+ BACKUP</b>	<b>DIGITAL COMPRESSORS + INVERTER with backup relay</b>	

### 9.3. ACTIVATE

- Regulation is activated after the time **SAFETY MEASURES > 565 - odo**
- the **QUICK START** parameters must be set **> 522-CtyP • 524- CtyP2**
- temperature probe or pressure sensor<sup>1</sup> must be configured to regulate suction (LP suction control probe)

**RESOURCE ALLOCATION > Analogue Inputs > 623-H401 ÷ 630-H408 → 1 circuit 1**

**RESOURCE ALLOCATION > Analogue Inputs > 623-H401 ÷ 630-H408 → 2 circuit 2**

### 9.4. TYPE OF CONTROL

Compressor control is a function of the Suction control probe.

**DISPLAY > 547-UMCP**

547-UMCP	TEMPERATURE	547-UMCP	PRESSURE
547-UMCP = 0	°C	547-UMCP = 1	bar
547-UMCP = 2	°F	547-UMCP = 3	PSI

Please note that, if using temperature control and the Suction control probe is a pressure transducer, suction control is a function of the value converted into temperature, based on gas selected, of the Suction control probe.

Behaviour is the same if the Suction control probe is a temperature probe and the control selected from **547-UMCP** is under pressure.

Parameter **547-UMCP** can be modified during normal system operations.

The default suction control is pressure (bar)

N.B.: The unit of measurement shown on the display may differ from that of the control unit.

<sup>1</sup> pressure: PB1 PB2 PB3; temperature PB5 ÷ PB8

## 9.5. REGULATION

### COMPRESSORS > Regulation/Alarms

Three regulation modes can be selected from

101-CCFn	Compressors control type	Notes
101-CCFn = 0	Proportional band control (BP)	<b>COMPRESSORS Regulation/Alarms 551-Stty</b> controls lateral and central set setpoint of regulation band
101-CCFn = 1	Dead band control (ZN)	
101-CCFn = 2	PID regulation	

### 9.5.1. PROPORTIONAL BAND CONTROL

Plant  
HOMOGENEOUS DIGITAL COMPRESSORS

#### Enabling

**COMPRESSORS > Regulation/Alarms > 101 - CCFn=0**

The power request from the suction regulator is proportional to the difference between the setpoint and the Suction control probe.

#### Proportional band: Homogeneous digital compressors

The regulator activates a number of power steps to reach the Set Point given in parameter **143-SEt**. The number of resources needed is linked to the difference between the value measured by the Suction control probe and the Set Point. Naturally, the greater the difference, the more resources needed to reach the Set Point.

The temperature or pressure interval between power steps is a function of the proportional band **144-Pbd** and the number of resources present.

e.g. lateral SEt (551 -Stty = 0)

e.g. 3 compressors x 2 steps each

**SET POINT** → **COMPRESSORS > Regulation Limits > 143 - SEt**

**BAND** → **COMPRESSORS > Regulation Limits > 144 - Sbd**

**sum of compressor steps** → **QUICK START >  $\sum$  502-PC1 + 503-PC2 + 504-PC3 + 505-PC4**

**$\Delta$**  →  **$144 - Pbd / \sum$  502-PC1 + 503-PC2 + 504-PC3 + 505-PC4**

## 9.5.2. DEAD ZONE CONTROL

### Plant

**HOMOGENEOUS DIGITAL COMPRESSORS or NON-HOMOGENEOUS DIGITAL COMPRESSORS**

### Enabling

**COMPRESSORS > Regulation/Alarms > 101 - CCFn=1**

The suction regulator power request is proportional to the time the Suction control probe (LP) stays outside the proportional band.

The proportional band is symmetrical to the setpoint value.

There are two proportional bands, one real and one 'extended'.

The extended band generally has greater values than the first one, indicates the region outside which power increase/decrease can be faster.

### Parameters

				Notes
<b>COMPRESSORS Regulation Limits</b>	<b>144 - Pbd</b>	<b>244 - Pbd</b>	Proportional band	
<b>COMPRESSORS Regulation Limits</b>	<b>145 - PbdE</b>	<b>245 - PbdE</b>	Extended proportional band	

The parameters that control times are:

Folder			Description
<b>COMPRESSORS Safety times</b>	<b>124-don</b>	<b>224-don</b>	ON steps time
	<b>125-doF</b>	<b>225-doF</b>	OFF steps time
<b>COMPRESSORS Safety times</b>	<b>126-FdLy</b>	<b>226-FdLy</b>	Enable dOn 1' step up (start up). Enables operation of the delay of parameter 124 - don / 224 - don also upon the request to enter steps for the first time after a condition of equilibrium. 0 = no; 1 = yes.
	<b>126-FdLy</b>	<b>227-FdLF</b>	Enable dOF 1' step down. Enables operation of the delay for the parameter 125 - doF/225 - doF also upon the request to deactivate the steps for the first time after a condition of equilibrium. 0= No, 1=Yes.

### Dead band: Homogeneous digital compressors

limit A → SET+BP/2  
limit B → SET+BP1/2

If the value read by the LP control probe exceeds **limit A** but is below **limit B** and if step ON time **124-don** has expired a step is actuated straight away<sup>2</sup> and step time is recounted.  
 If the value read by the LP control probe stays in this band, a further power step is actuated every **124-don** seconds.  
 If the value read by the LP control probe exceeds the **limit A** value and if step ON time has already expired, a step is actuated straight away<sup>3</sup> and time recounted **124-don/2**.  
 As long as the value read by the LP control probe stays above this last limit power steps will be increased every **124-don/2**.

The same applies for switch off, with times settable from parameter **125-doF**.

Power variations are not requested inside the proportional band.

All interstep times are re-synchronized when a new step is activated/de-activated.  
 The step to be entered/deactivated based on parameter **552-PoLI**.

### Dead band: Non-homogeneous digital compressors

Same as **Homogeneous digital compressors**

The increase **+1** indicates the request for power increase, while **-1** indicates the request for a power decrease.

The power increase/decrease that can be implemented is illustrated in paragraph '9.7. RESOURCE SELECTION POLICIES' page 75

### Dead band: Homogeneous + INVERTER digital compressors (mixed system)

**Note. The setpoint is always central, regardless of the parameter COMPRESSORS> Regulation/Alarms > 551-Stty** which controls the lateral and central setpoint in relation to the regulation band

<sup>2</sup> see parameters for times, in particular 126-FdLy and 127-FdLF

<sup>3</sup> see parameters for times, in particular 126-FdLy and 127-FdLF

### 9.5.3. PID CONTROL

**Plant**  
**HOMOGENEOUS or HOMOGENEOUS + INVERTER DIGITAL COMPRESSORS**

**Enabling**  
**COMPRESSORS > Regulation/Alarms > 101 - CCFn=2**

The power requested by the suction regulator is a function of the difference between the LP control probe - Setpoint and is equal to the sum of three terms:

**P proportional to the error:** considers the difference between value read by the LP control probe and the Set Point, entering an action that is directly proportional to it; the proportional component action decreases as the error approaches zero;

**I proportional to the error integral:** integrates the error detected over time, reducing the final difference from the Set Point; this function tracks previous control values, providing a corrective action able to add or remove power gradually to get closer to the Set Point value.

**D proportional to the error derivative:** considers the speed with which the control value varies in the process; this provides a faster response in system control, inasmuch as the correction is greater the greater the rate of change of the error;

You can set the following with parameters:

	Folder		Parameter	Description
Enabling	COMPRESSORS Regulation/Alarms	102 - ItEn	202 - ItEn	enabling integral control =1
	COMPRESSORS Regulation/Alarms	104 - PbEn	204 - PbEn	enabling proportional control =1
	COMPRESSORS Regulation/Alarms	105 - dtEn	205 - dtEn	enabling derivative control =1
Values	COMPRESSORS Regulation/Alarms	106 - It	206 - It	integrative time constant value <b>Ti</b>
	COMPRESSORS Regulation Limits	144 - Pbd	244 - Pbd	proportional band value <b>Bp</b>
	COMPRESSORS Regulation/Alarms	106 - dt	206 - dt	derivative time constant value <b>Td</b>

#### **PID: Homogeneous digital compressors**

The control signal results in the activation of a number of resources (power steps) proportional to the signal itself. After the last power step has been activated and for values above the proportional band, please refer to the diagram of the previous example with the following warning: modulation in the step has no hysteresis.

**PID: Homogeneous + INVERTER digital compressors (mixed system)**

The number of power steps implemented is proportional to the signal while the power the INVERTER is controlled at varies in a linear way between two discrete power increases/decreases of step compressors.

With an INVERTER Error with **522 - CtyP / 523 - CTyP2 = 3** the continuous control compressor will be controlled as in **PID: Homogeneous digital compressors**

**Example 2 HOMOGENEOUS DIGITAL COMPRESSORS + COMPRESSOR INVERTER**

Rated power at mains frequency > the same as compressors ON-OFF

		INVERTER POWER	
Minimum frequency	25Hz	minimum	50%
Maximum frequency	85Hz	maximum	80%
Switch-on frequency	40Hz	start	170%
Rated power	Rated power (Ptarga)		
Line frequency	50Hz		

**COMPRESSOR INVERTER POWER** (referred to rated power) with mains frequency 50Hz:

$P_{inv\_min} = (114 - \ln LFr / 50Hz) * 117 - \ln RP (Ptarga) = 50\% Ptarga;$

$P_{inv\_start} = (116 - \ln SFr / 50Hz) * 117 - \ln RP (Ptarga) = 80\% Ptarga;$

$P_{inv\_max} = (115 - \ln MFr / 50Hz) * 117 - \ln RP (Ptarga) = 170\% Ptarga;$

**TOTAL PLANT POWER =  
COMPRESSOR ON/OFF RATED POWER + MAXIMUM INVERTER POWER = 3.7 \* RATED POWER**

Normalised 'weights' of single compressors will be:

**Compressor ON-OFF power:**  $Ptarga / Ptot \rightarrow PER_{on\_off} = 27\%;$

**Inverter power:**

- $PER_{inv\_min} = P_{inv\_min} / Ptot = 13.5\%;$
- $PER_{inv\_start} = P_{inv\_start} / Ptot = 21.6\%;$
- $PER_{inv\_max} = P_{inv\_max} / Ptot = 46\%$

To sum up, the example shows us the following situations

Compressors on			POWER
		Inverter	$13.5 \div 46\% (21.6 \div 46\% \text{ con inverter OFF})$
	Compressor 1	Inverter	$40.5 \div 73\%$
Compressor 2	Compressor 1	Inverter	$67.5 \div 100\%$

As the table shows, the three situations overlap, so there will be continuous control, and the greater the overlapped area the lower the number of compressor start-ups ON-OFF.

**FREQUENCY > 25...87Hz POWER > 50..174% (100%)**

Let's consider cases where the working areas do not overlap, like in the following example:

To sum up, the example shows us the following situation

Compressors on			POWER
		<b>Inverter</b>	13.5 ÷ 40% (21.6 ÷ 40% con inverter OFF)
	<b>Compressor 1</b>	<b>Inverter</b>	43 ÷ 73%
<b>Compressor 2</b>	<b>Compressor 1</b>	<b>Inverter</b>	73.5 ÷ 100%

The regulator algorithm will only activate the compressors if the power requested complies with one of the work areas; otherwise the previous situation will be maintained.

## 9.6. COMPRESSOR SAFETY TIMES

### 9.6.1. SAFETY TIMES DIGITAL COMPRESSORS

#### Parameters

The parameters that control times are:

Folder			Description
COMPRESSORS Safety times	<b>121-oFon</b>	<b>221-oFon</b>	Compressor OFF - ON time
	<b>122-donF</b>	<b>222-donF</b>	Compressor ON - OFF time
	<b>123-onon</b>	<b>223-onon</b>	Compressor ON - ON time
	<b>124-don</b>	<b>224-don</b>	ON steps time
	<b>125-doF</b>	<b>225-doF</b>	OFF steps time
COMPRESSORS Safety times	<b>126-FdLy</b>	<b>226-FdLy</b>	Enable dOn 1' step up (start up). Enables operation of the delay of parameter 124 - don / 224 - don also upon the request to enter steps for the first time after a condition of equilibrium. 0 = no; 1 = yes.
	<b>126-FdLy</b>	<b>227-FdLF</b>	Enable dOF 1' step down. Enables operation of the delay for the parameter 125 - doF/225 - doF also upon the request to deactivate the steps for the first time after a condition of equilibrium. 0= No, 1=Yes.

#### Switch on-off

#### Enter and deactivate steps

Entering and deactivating power steps must respect the activation and release times between resources

**124-don** and **125-doF** and is also a function, besides of compressor type (homogeneous or non-homogeneous), of parameters **126-FdLy** and **127-FdLF**.

## Enter and deactivate steps

### Enter HOMOGENEOUS steps

#### **126-FdLy=0**

it is enough to comply with the increment interstep time **124-don** which is started when each resource is entered;

#### **126-FdLy=1**

- If the increment interstep time count was already under way due to a previous step being activated, then this delay must expire before another resource can be activated;
- If the increment interstep time count has already expired, the increment interstep time is reloaded when a resource is called by the regulator;

### Enter NON HOMOGENEOUS steps

#### **126-FdLy=0**

it is enough to comply with the increment interstep time **124-don** which is started when each resource is entered;

#### **126-FdLy=1**

the increment interstep time is reloaded when a resource is called by the regulator only if the activation would result in exiting the dead zone;

### Deactivate HOMOGENEOUS steps

#### **127-FdLF=0**

it is enough to comply with the decrement interstep time **125-doF** which is started when each resource is deactivated;

#### **127-FdLF=1**

- If the decrement interstep time count was already under way due to a previous step being deactivated, then this delay must expire before another resource can be deactivated;
- If the decrement interstep time has already expired, then it is reloaded when the regulator calls for another resource to be deactivated;

### Deactivate NON HOMOGENEOUS steps

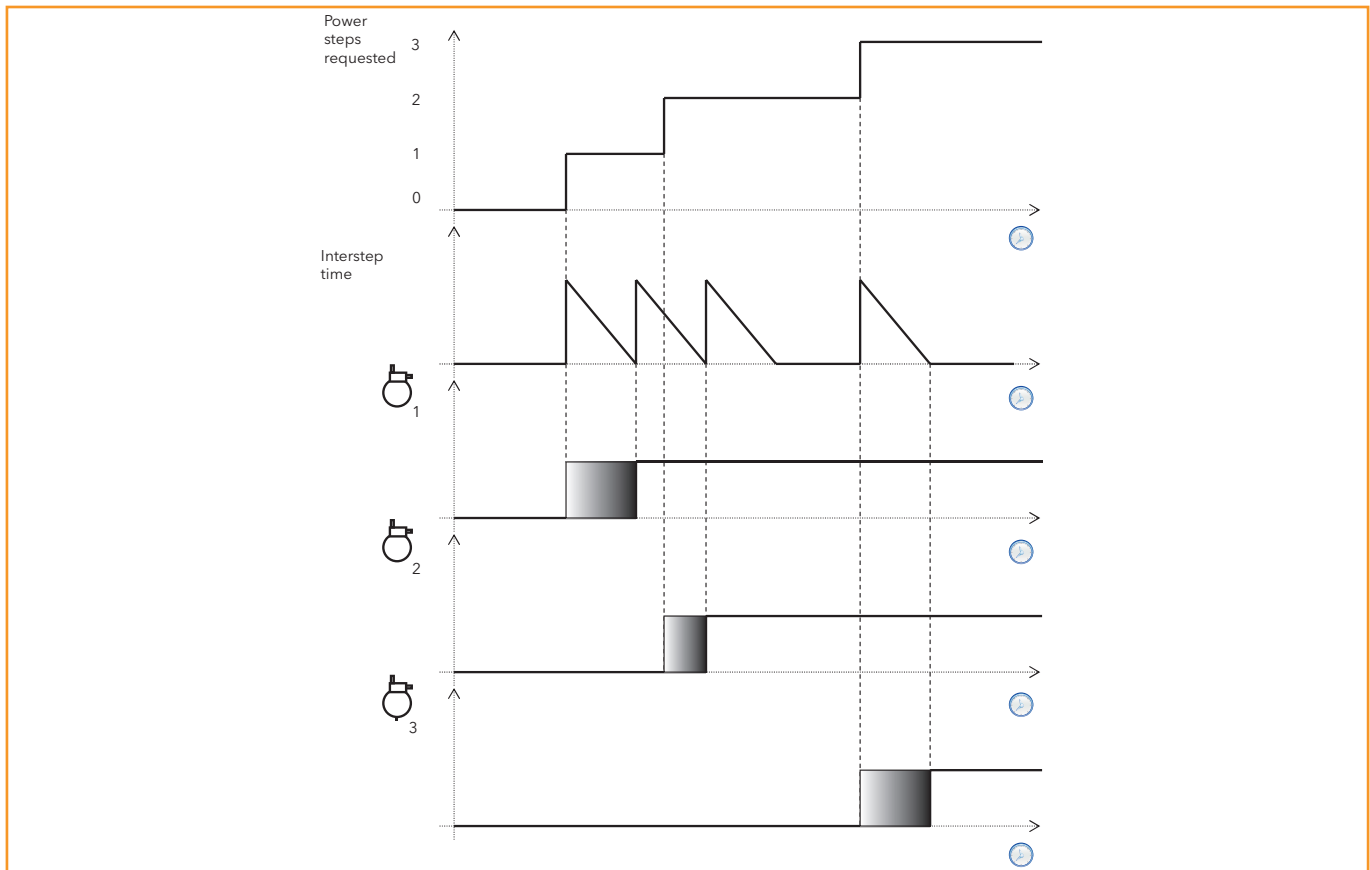

#### **126-FdLy=0**

it is enough to comply with the decrement interstep time **125-doF** started when each resource is deactivated

**126-FdLy=1** the decrement interstep time is reloaded when the regulator calls for another resource to be deactivated, only if this would result in exiting the dead zone.

### Example of steps entered with three homogeneous compressors with 126-FdLy =1

### Example of steps entered with four homogeneous compressors with 126-FdLy =0

### 9.6.1.1 STAGES OF HOMOGENEOUS STEP COMPRESSORS

#### Quick Start parameters

Configuration of a circuit with staged compressors is through Quick Start parameters

<b>STEPS o POWER COMPRESSORS</b>	<b>502-PC1</b>	Compressor 1 power or number of compressor 1 steps
	<b>503-PC2</b>	Compressor 2 power or number of compressor 2 steps
	<b>504-PC3</b>	Compressor 3 power or number of compressor 3 steps
	<b>505-PC4</b>	Compressor 4 power or number of compressor 4 steps
	<b>506-PC5</b>	Compressor 5 power or number of compressor 5 steps
	<b>507-PC6</b>	Compressor 6 power or number of compressor 6 steps
	<b>508-PC7</b>	Compressor 7 power or number of compressor 7 steps
	<b>509-PC8</b>	Compressor 8 power or number of compressor 8 steps
	<b>510-PC9</b>	Compressor 9 power or number of compressor 9 steps
	<b>511-PC10</b>	Compressor 10 power or number of compressor 10 steps
	<b>512-PC11</b>	Compressor 11 power or number of compressor 11 steps
	<b>513-PC12</b>	Compressor 12 power or number of compressor 12 steps

**Step = Stages + 1**

**1 step → no stages (whole compressor)**

**2 steps → 1 stage**

**5 steps → 4 stages**

**502-PC1 ÷ 513-PC12 = 1** → whole compressors and can supply 0% or 100% of their power.

**502-PC1 ÷ 513-PC12 = 4** → (4 steps): 3 stages established

The compressors can supply 0%, 25%, 50%, 75% or 100% of their power.

Up to 5 stages relays can be handled

Parameters **502- PC1 • 513 - PC12 Compressor power or number of compressor steps** establish:

**for HOMOGENEOUS compressors:** number of compressor steps

**for NON HOMOGENEOUS compressors** value proportional to power

#### Parameters

Parameters controlling the stages sequence are:

Folder			Description
<b>COMPRESSORS Regulation/Alarms</b>	<b>118-PtSE</b>	<b>218-PtSE</b>	Compressor steps sequence. This parameter depends on the compressor model being used. Depending on the mode set in the compressor to manage the power stages, the following options are available :
			<b>0</b> = Activation of power stage (solenoid valve) → Power decrease <b>1</b> =Simple power stage → each power stage will enable a specific power <b>2</b> = Activation of power stage (solenoid valve) → Power increase

E.g. **4 steps → 3 stages**

Power	118-PtSE =0				118-PtSE =1				118-PtSE =2			
	Step				Step				Step			
	Compressor ON	Stage			Compressor ON	Stage			Compressor ON	Stage		
1		2	3	1		2	3	1		2	3	
100%	ON				ON				ON	ON	ON	
75%	ON			ON	ON			ON	ON	ON		
50%	ON		ON	ON	ON		ON		ON	ON		
25%	ON	ON	ON	ON	ON	ON			ON			
0%												

## COMPRESSOR INVERTER > Safety time and operating modes

Parameters controlling times and operating modes are:

Folder			Description
<b>COMPRESSORS Regulation/Alarms</b>	<b>110 - InMode</b>	<b>210 - InMode</b>	Inverter mode. <b>0</b> = inverter sequence 'First In Last Out', <b>1</b> = standard
<b>COMPRESSORS Inverter</b>	<b>129 - Inot</b>	<b>229 - Inot</b>	Max time INVERTER at minimum power
	<b>130 - InLt</b>	<b>230 - InLt</b>	Interval between inverter minimum and new power step activation
	<b>131 - InoFon</b>	<b>231 - InoFon</b>	Inverter OFF - ON time
	<b>132 - Inonon</b>	<b>232 - Inonon</b>	Inverter ON - ON time
	<b>133 - InSwT</b>	<b>233 - InSwT</b>	Minimum inverter switch on time
<b>COMPRESSORS Regulation limits</b>	<b>154 - InLPt</b>	<b>254 - InLPt</b>	Threshold for INVERTER operation at minimum power

### COMPRESSOR INVERTER MODE > 110-InMode: inverter sequence

**110-InMode = 0** the inverter compressor is always the first to switch on and the last to switch off (sequence 'First In Last Out') compared to digital compressors in the circuit, unless there is an alarm.

**110-InMode = 1** switch on and switch off of digital compressors and the inverter only take place based on their availability (safety times and alarms).

### COMPRESSOR INVERTER > 130-InLt: only with increasing power.

When the gear changes, first the digital step is activated and then INVERTER power is reduced. At switch off there are no delays between step deactivation and control of INVERTER

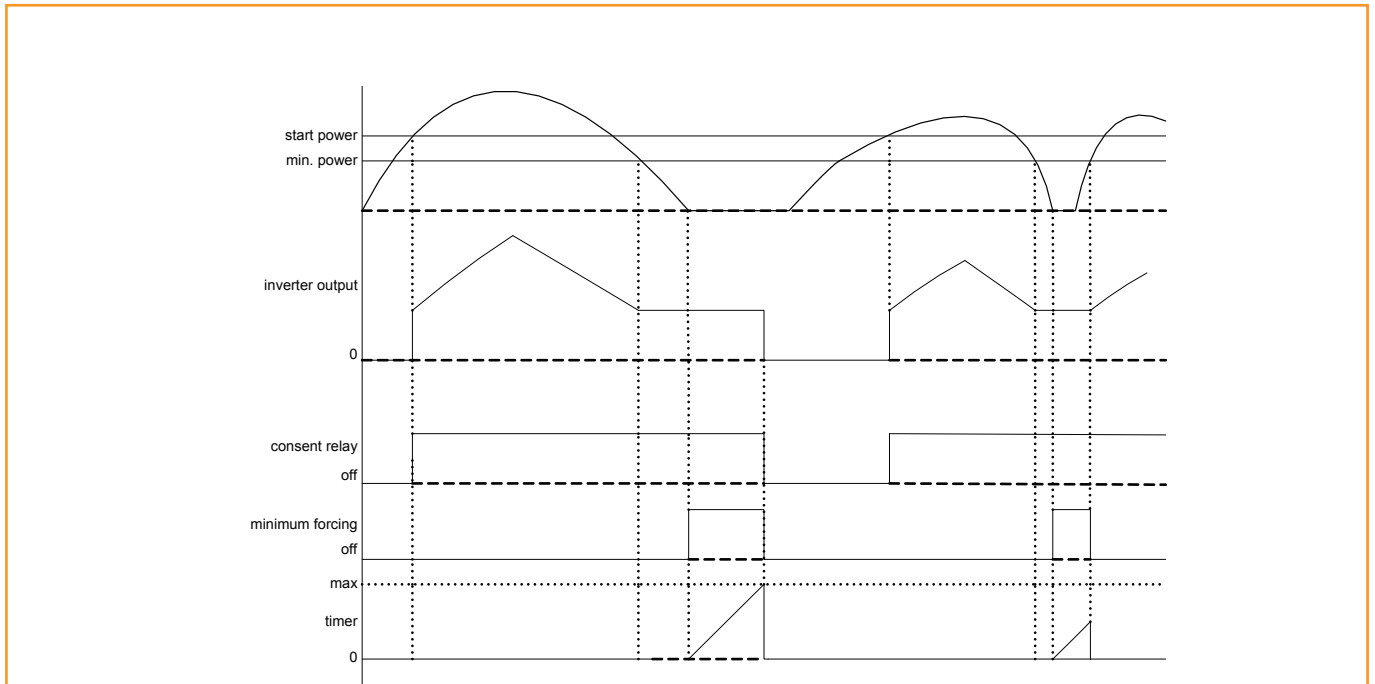

**COMPRESSOR INVERTER > 129-Inot = 0**

## COMPRESSOR INVERTER > 129-Inot = over 0

During minimum forcing if temperature or pressure drops below the limit **154-InLPt** inverter output, relay consent, timer and minimum forcing will be forced to zero.

## 9.7. RESOURCE SELECTION POLICIES

The resource selection policies are generally employed to optimise use of the compressors so as to increase their service life and reduce maintenance. They are also used to emphasise dynamic plant behaviours such as saturation and balancing.

The policies apply to all types of circuit with step compressors

### Compressor activation policy

Selection policies come into play when the regulator requests step activation/deactivation. This request is distributed to the most 'suitable' compressor based on policy selected.

The selection policies are mainly based on compressor hours of operation. Using the parameter

### COMPRESSORS > Regulation/Alarms > 552-PoLI

you can select one of the following policies:

552-PoLI		
552-PoLI = 0	fixed sequence;	
552-PoLI = 1	rotation of compressors (balancing);	
552-PoLI = 2	saturation 1; distribution of resources on smallest number of compressors possible to obtain highest number of compressors turned off.	
552-PoLI = 3	saturation 2; same as saturation 1, except that all compressors must reach minimum power level (one step) before starting switch-off.	

### MASTER COMPRESSOR

For all systems with step compressors, independent of type of control and policy, one of the step compressors may be defined as the 'Master' compressor.

It is selected with parameter

### COMPRESSORS > Regulation/Alarms > 120-nCPC

The master compressor is the one which turns on first and switches off last. In the case of staged compressors, in response to power step increment requests the master compressor will always be augmented before the other compressors on the circuit are made available.

### 9.7.1. HOMOGENEOUS STEPS AND HOMOGENOUS STEPS + INVERTER

#### FIXED SEQUENCE → COMPRESSORS > Regulation/Alarms > 552-PoLI = 0

The fixed sequence policy distributes all resources starting from the compressor with the lowest index, so far as this is compatible with other requirement limits, such as compressor safety times. The resulting allocation is such as to obtain, at any given time, maximum supply levels from compressors with lower indexes.

Note that:

- on request for a step increment, components which may increment are considered and the one with the lowest index is selected;
- on request for a step decrement, components which may decrement are considered and the one with the highest index is selected;

#### MASTER COMPRESSOR FIXED SEQUENCE

At switch on, the master is always turned on first and taken to saturation, after which the other compressors are turned on and saturated in fixed sequence without reference to the master. At switch off, all compressors excluding the master are switched off based on fixed sequence policy (as per saturation policy) and the master is the last to be switched off.

**BALANCING** → **COMPRESSORS > Regulation/Alarms > 552-PoLI =1**

The balancing policy distributes all resources equally over the largest possible number of compressors, so far as this is compatible with other requirements, such as compressor safety times. The resulting allocation is such as to have the greatest possible equalisation of compressor supply levels at any one time.

Note that:

- on request for a step increment, components which may increment are considered and the one with the smallest distance from the minimum number of deliverable steps at that time is selected. At the same distance, the one with the lowest hours of operation is chosen;
- on request for a step decrement, components which may decrement are considered and the one with the largest distance from its minimum number of deliverable steps at that time is selected. At equal distance, the component with the highest hours of use is selected.

**MASTER COMPRESSOR BALANCING**

The master is switched on first then the others in balancing mode, master included. At switch off, all compressors including the master are switched off in balancing mode, but the master is the last to be turned off.

**SATURATION 1** → **COMPRESSORS > Regulation/Alarms > 552-PoLI =2**

The saturation 1 policy distributes all resources equally over the smallest possible number of compressors, so far as this is compatible with other requirements, such as compressor safety times. The resulting allocation is intended to have the largest possible number of compressors switched off at any one time.

Note that:

- on request for a step increment, components which may increment are considered and the one with the smallest distance from the maximum number of deliverable steps at that time is selected. At the same distance, the one with the lowest hours of operation is chosen;
- on request for a step decrement, components which may decrement are considered and the one with the smallest distance from the minimum number of deliverable steps at that time is selected. At equal distance, the component with the highest hours of use is selected;

**MASTER COMPRESSOR SATURATION 1**

At switch on, the master is turned on first and taken to saturation, then the others are turned on. At switch off, all compressors are switched off in saturation mode, except for the master which is the last to be turned off.

**SATURATION 2** → **COMPRESSORS > Regulation/Alarms > 552-PoLI =3**

Like saturation 1, with the following exceptions

- tries to avoid restarting a compressor which has just been switched off
- when a decrement request occurs, before switching off the last active step of a compressor it is advisable to switch off a step of another compressor, to avoid requests to switch the same compressor back on

**Example**

**3 compressors x 3 steps**

At first they are all on. The switch off sequence will be:

	1	2	3
1	100%	100%	100%
2	100%	100%	66%
3	100%	100%	33%
4	100%	66%	33%
5	100%	66%	33%
6	100%	33%	33%
7	66%	33%	0%
8	33%	0%	0%
9	0%	0%	0%

## MASTER COMPRESSOR SATURATION 2

In switch off where all compressors, except for the master, are decremented until they are providing only one step, then they are switched off, after which the master is decremented until it switches off.

### 9.7.2. NON-HOMOGENEOUS STEPS

When the power supply is varied, selection criteria for the new active compressor configuration are as follows:

- In the case of increased power, the configuration which results in the smallest increase has priority;
  - In the case of decreased power, the configuration which results in the smallest decrease has priority;
  - For a given power supply, the configuration which requires switching on the smallest number of compressors has priority; if more than one configuration meets this requirement, the one with the smallest number of compressors is chosen, and after that, the configuration which has operated less.
  - If the power supplied is stable, and an alarm shutting down one or more of the active compressors occurs, a power increase request is issued to obtain the maximum power which does not exceed the initial discharge.
- In the new situation, the power actuated is considered to be stable.

### MASTER COMPRESSOR NON NOMINAL CASES

- If the master compressor has an alarm or is deselected when active it is switched off and the selection of successive power steps follows the selected policy as if the master compressor did not exist.
- If the circuit the master compressor belongs to is switched off and the master compressor is in alarm or deselected, then if the regulator for the circuit in question requests power, available compressors are activated according to the policy selected. Basically, if the master compressor cannot be used due to alarm or de-selection, this does not make it impossible to enter resources.
- If the circuit the master compressor belongs to is switched off and the master compressor is not in alarm and is selected but its safety time is counting down, then, if the regulator for the circuit in question requests power the master compressor is switched on first, as soon as its safety time has expired. In the meantime, the other compressors are kept switched off.
- If the master compressor exits an alarm condition when some of the compressors on its circuit are already active, it 'loses its privileges' when the regulator requests power steps. If the regulator requests step deactivation, the master compressor 'gets its privileges back'.

## 9.8. INVERTER

Compressors controlled by inverter, can only operate above a pre-set speed (which depends on compressor type)

### ANALOG OUT

The INVERTER uses a 0-10V output with which to modulate compressor speed, in the range between minimum and maximum speed allowed (**FMIN** → **FMAX**)

### Minimum speed

**FMSTART** → Minimum speed such that the compressor has the pair needed to be able to switch-on

### Parameters

**ANALOGUE OUTPUTS** > set = 2 or 3

Analogue Outputs	
<b>631-H501</b>	V1/I1 analogue OUT <b>0</b> =Disabled; <b>1</b> =FAN INVERTER switch-on; <b>2</b> =compressor inverter circuit C1 switch on <b>3</b> =Compressor inverter circuit C2 switch on; <b>4</b> = analogue output regulator configurable step 1
<b>632-H502</b>	V2/I2 analogue OUT. See <b>631-H501</b>
<b>633-H503</b>	V3/I3 analogue OUT see <b>631-H501</b>

Frequency plate data is found in the technical sheet attached to the INVERTER, or on the compressor plate

**FMIN** → **COMPRESSORS > Inverter > 114 - InLFr**  
**FMAX** → **COMPRESSORS > Inverter > 115 - InMFr**  
**FSTART** → **COMPRESSORS > Inverter > 116 - InSFr**

### INVERTER error

**circuit 1 QUICK START** > **522 - CtyP = 3**

**circuit 2 QUICK START** > **523 - CtyP2 = 3**

the continuous control compressor will be controlled by activation/deactivation of a power step.

For compressor control we must consider both homogeneous compressor power and that of compressor inverters.

The compressor inverter has the following parameters:

### COMPRESSOR INVERTERS

	Folder			
Minimum frequency	COMPRESSORS Inverter	114-InLFr	214-InLFr	Inverter minimum frequency
Maximum frequency		115-InMFr	215-InMFr	Inverter maximum frequency
Switch-on frequency		116-InSFr	216-InSFr	Switch Inverter frequency
Rated power		117-InRP	217-InRP	Inverter rated power at network frequency
Line frequency	COMPRESSORS Regulation/Alarms	698-SUPFr		Line frequency 0=50Hz; 1=60Hz

### DIGITAL COMPRESSORS

The rated power of digital compressors is characterised by:

	Folder			
Rated power	COMPRESSORS Regulation/Alarms	128-CRP	228-CRP	Digital compressor rated power at network frequency

**Note.** Inverter plant control requires all ON-OFF compressors to be **HOMOGENEOUS** and that they have the same rated power.

## 10. FANS

### 10.1. FANS

Parameters controlling fans are visible in the folder and sub-folders

#### PARAMETERS > FANS

#### 10.1.1. DISCHARGE TYPE

With assisted configuration, in the Quick Start Menu, the discharge section must be set with the parameter

#### QUICK START > 520- Fnty

The discharge section can be present or not but the suction one is always present

Controls can be selected from parameter **FANS > Regulation/Alarms > 301 - FCFn**

	Quick Start parameter 520- Fnty		Regulation parameter 301 - FCFn
0	DISABLED	discharge control disabled	-
1	INVERTER	INVERTER	PROPORTIONAL BAND DEAD BAND PID
2	DIGITAL	DIGITAL FANS	
3	INVERTER + BACKUP	INVERTER with backup relay	
4	DIGITAL + INVERTER	DIGITAL FANS + INVERTER	
5	DIG + INV + BACKUP	DIGITAL FANS + INVERTER with backup relay	

#### 10.1.2. ACTIVATE

- Regulation is activated after the time **SAFETY MEASURES > 565 - odo**
  - **QUICK START > 520-Fnty ≠ 0 (discharge section present)**
  - a temperature probe or a pressure sensor must be configured to control discharge (HP control probe)
- RESOURCE ALLOCATION > Analogue Inputs > 623-H401 ÷ 630-H408 → 3**

#### 10.1.3. TYPE OF CONTROL

- Digital fans **QUICK START > 520-Fnty = 2** (max 8 fans).
- Fan INVERTERS **QUICK START > 520-Fnty = 1** (the fan battery will be controlled by a single analogue output)

Fan control is a function of the HP control probe.

The parameter **DISPLAY > 548-UMFn Discharge UM** selects control under pressure (bar/PSI) or temperature (°C/°F)<sup>1</sup>.

Note that, if using temperature control and the HP control probe is a pressure transducer, discharge control is a function of the value converted into temperature of the selected gas, by the HP control probe.

Behaviour is mutual if the HP control probe is a temperature probe and control selected from **548-UMFn** is under pressure.

Parameter **548-UMFn** can be modified during normal plant operations.

The default discharge control is pressure (bar).

N.B.: The unit of measurement shown on the display may differ from that of the control unit.

<sup>1</sup> based on [545-UMMin, 546-UMMax]. See section '4.4.4. UNIT OF MEASUREMENT' page 27

## 10.1.4. DIGITAL FANS

Fans are controlled by digital outputs with Quick Start

**QUICK START > 520-Fnty = 2** (max 8 fans).

Any error conditions are signalled by digital inputs (digital fan thermal switch).

### 10.1.4.1 Times

Safety times can be configured with parameters in the folder

**FANS > Safety times**

#### Delays

- **FANS > Safety times > 324-don** defines the delay, in seconds, between the calls for two different steps (activation of different fans).
- **FANS > Safety times > 325-doF** defines the delay, in seconds, between the release of two different steps (switch off of different fans).

#### Fan stop

**FANS > Safety times > 326-FStt**

This parameter defines the maximum fans off time

Once that time is over fans are forced on for a 'pick-up' time

**FANS > Safety times > 331-FPkUP**

#### Pick-up<sup>[2]</sup>

Once off time is over fans are forced at maximum speed for the pick-up time

**FANS > Safety times > 323-Clt**

• **326-FStt = 0** → fans can remain off indefinitely

• **326-FStt > 1 & 331-FPkUP = 0** → fans remain off until **331-FPkUP** is placed on a non 0 value.

If **323 - Clt = 0** there is no pick-up.

Fans can be used for a maximum number of hours defined by

**FANS > Safety times > 327-SEr (hours)**

#### Safety time parameters

Folder	Parameter	Description
FANS Safety Times	<b>323-Clt</b>	Pick-up time Time for which the fans run at 100% when the fan battery is switched on
FANS Safety Times	<b>324-don</b>	ON steps time Delay time between the calls of two different steps.
FANS Safety Times	<b>325-doF</b>	OFF steps time Delay time between switching off two different steps.
FANS Safety Times	<b>326-FStt</b>	Max OFF time Maximum fans off time.
FANS Safety Times	<b>327-SEr</b>	Fan max usage time
FANS Safety Times	<b>331-FPkUP</b>	Pick-up time after maximum OFF time

<sup>2</sup> see section '10.1.7. FAN PICKUP' page 84

### 10.1.5. ROTATION

#### FANS - Regulation/Alarms

**FANS > Regulation/Alarms 322-rot** defines fan rotation when called and released to obtain the same number of hours of operation.

	322-rot	Activation policy	Notes
<b>FANS Regulation/Alarms</b>	<b>322-rot = 0</b>	<b>fixed sequence:</b> in the switch on phase the activation sequence is fan 1, 2, 3... for switch off the phase is inverted.	
<b>FANS Regulation/Alarms</b>	<b>322-rot = 1</b>	<b>rotation:</b> in the switch on phase the fan with the least hours will be chosen; during switch off, the fan with the most hours of operation.	balancing number of hours of operation.

### 10.1.6. FAN INVERTER

The fan INVERTER is controlled through analogue output by Quick Start parameter

**QUICK START > 520-Fnty = 1** (the fan battery will be controlled by a single analogue output)

Configuration options are:

- Digital output to activate INVERTER is optional
- Digital output for INVERTER error is optional

Any error conditions are signalled by digital inputs (fan thermal switch with continuous control).

N.B.: Parameter **QUICK START > 521-nFn** (number of fans) is NOT important in this case as the INVERTER analogue output is used.

INVERTER parameters are configurable in the folders

**FANS > Inverter**

**FANS > Regulation/Alarms**

## Speed

		Speed
FANS Regulation/Alarms	<b>309-InLSP</b>	minimum fan speed %.
FANS Regulation/Alarms	<b>310-InMSP</b>	maximum fan speed %.
FANS Regulation/Alarms	<b>311-InSSP</b>	fan saturation speed %.

### Fan INVERTER - max. speed

If the discharge regulator requires a power greater than **311-InSSP**, the INVERTER will be controlled at speed **311-InSSP**.

### Fan INVERTER - min. speed

- If **309-InLSP = 0** the INVERTER is controlled at the speed defined by the discharge regulator;
- If **309-InLSP ≠ 0** there are 2 cases:

the discharge regulator request is less than **309-InLSP** but  $\neq 0$ : the INVERTER will be forced at minimum speed defined by **309-InLSP**. In this case if the HP control probe < 345-InLPt and time 565-odo (alarm de-activation at switch on) has expired, the INVERTER switches off and the enabling digital output is de-activated.

1. the discharge regulator request = 0 INVERTER behaviour is defined by **330 - InoS**:

Based on value of **330-InoS** there are 2 sub-cases

		Activation policy
FANS Inverter	<b>330-InoS = 0</b>	INVERTER continues to be controlled at the minimum speed defined by 309-InLSP for the time 328-Inot after which the INVERTER is switched off and the enabling digital output is de-activated.
FANS Inverter	<b>330-InoS = 1</b>	INVERTER continues to be controlled at the minimum speed defined by 309-InLSP
FANS Inverter	<b>328 - Inot</b>	Maxi time INVERTER at minimum power

## 10.1.7. FAN PICKUP

### FANS > Safety times

#### Operating conditions

When first switched on fans are forced to **maximum** power for the time defined by the parameter

### FANS > Safety times > 323-Clt

**maximum** power **DIGITAL FANS** → **100%**

**maximum** power **FAN INVERTER** → parameter **FANS > Regulation/Alarms > 311 - InSSP**

If **323 - Clt = 0** there is no pick-up.

After pickup, the fans are run as required by the discharge regulator.  
In an alarm locking out the fan battery, fans are switched off in any case.

#### Digital fans Pick-up

Digital fans pick-up with discharge regulator request

1. stable at end of pick-up time
2. in increment at end of pick-up time

**tr: fan request**

**REQ number of steps requested**

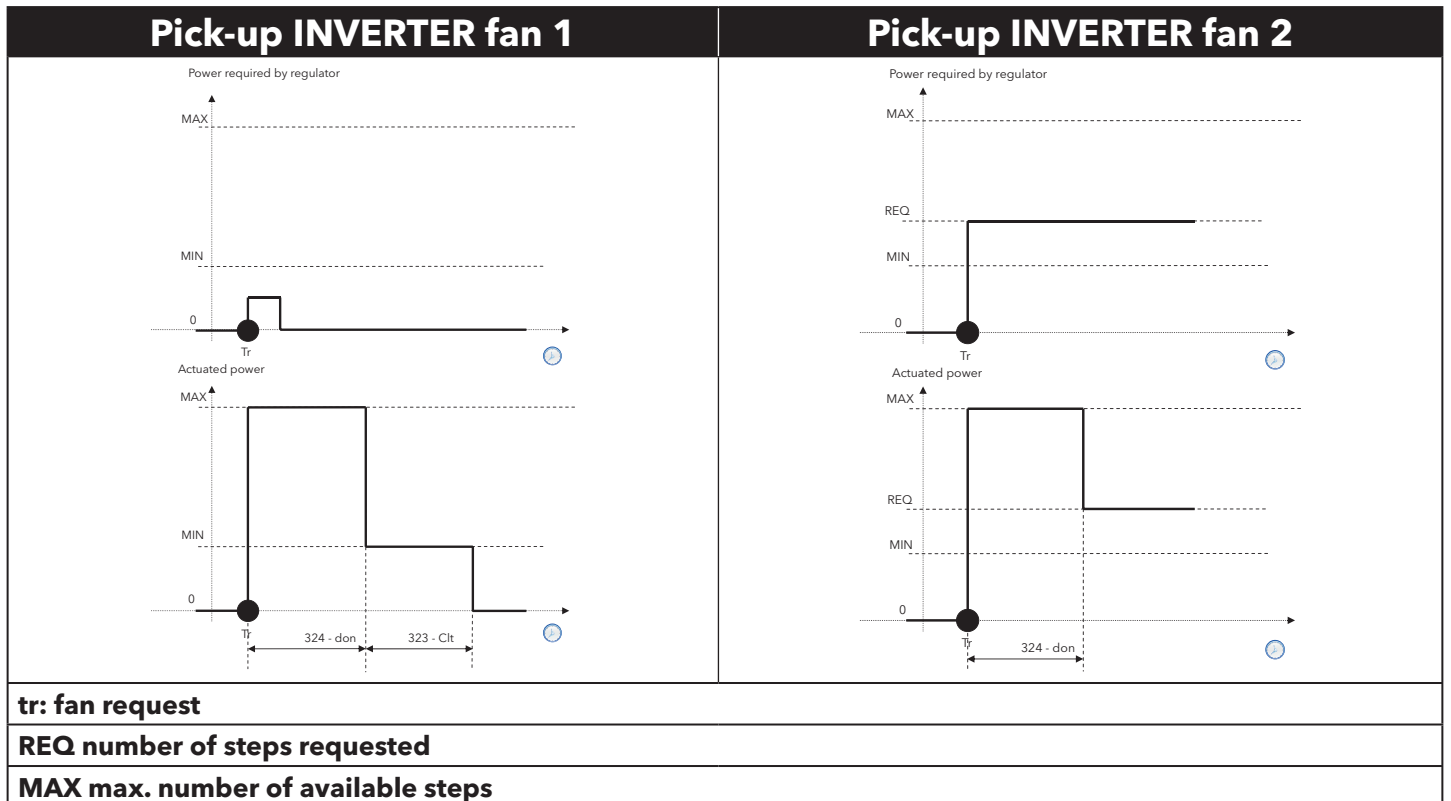

**MAX max. number of available steps**

### Fan INVERTER Pick-up

- Fan INVERTER pick-up with discharge regulator request zero during pick-up. After pick-up time fans will be forced at minimum for the **328 - Inot** time to then switch off
- Pick-up with regulator request constant and greater than **309-InLSP**. After pick-up time fans will be forced at **REQ**:

<b>FANS Regulation/Alarms</b>	<b>309-InLSP</b>	Minimum speed.
<b>FANS Inverter</b>	<b>328-Inot</b>	Max time INVERTER at minimum power

## 10.1.8. REGULATION

### FANS - Regulation/Alarms

Three regulation modes can be selected from

301 - FCFn	Fan control type	Notes
301 - FCFn = 0	Proportional band control (BP)	If proportional the parameter <b>COMPRESSORS &gt; Regulation/Alarms 551-Stty</b> controls lateral and central set setpoint of regulation band
301 - FCFn = 1	Dead band control (ZN)	
301 - FCFn = 2	PID regulation	

302 - FACT	Activation mode	Notes
302 - FACT = 0	independent of compressor status	
302 - FACT = 1	if at least 1 compressor is on.	

#### 10.1.8.1 PROPORTIONAL BAND FAN REGULATION

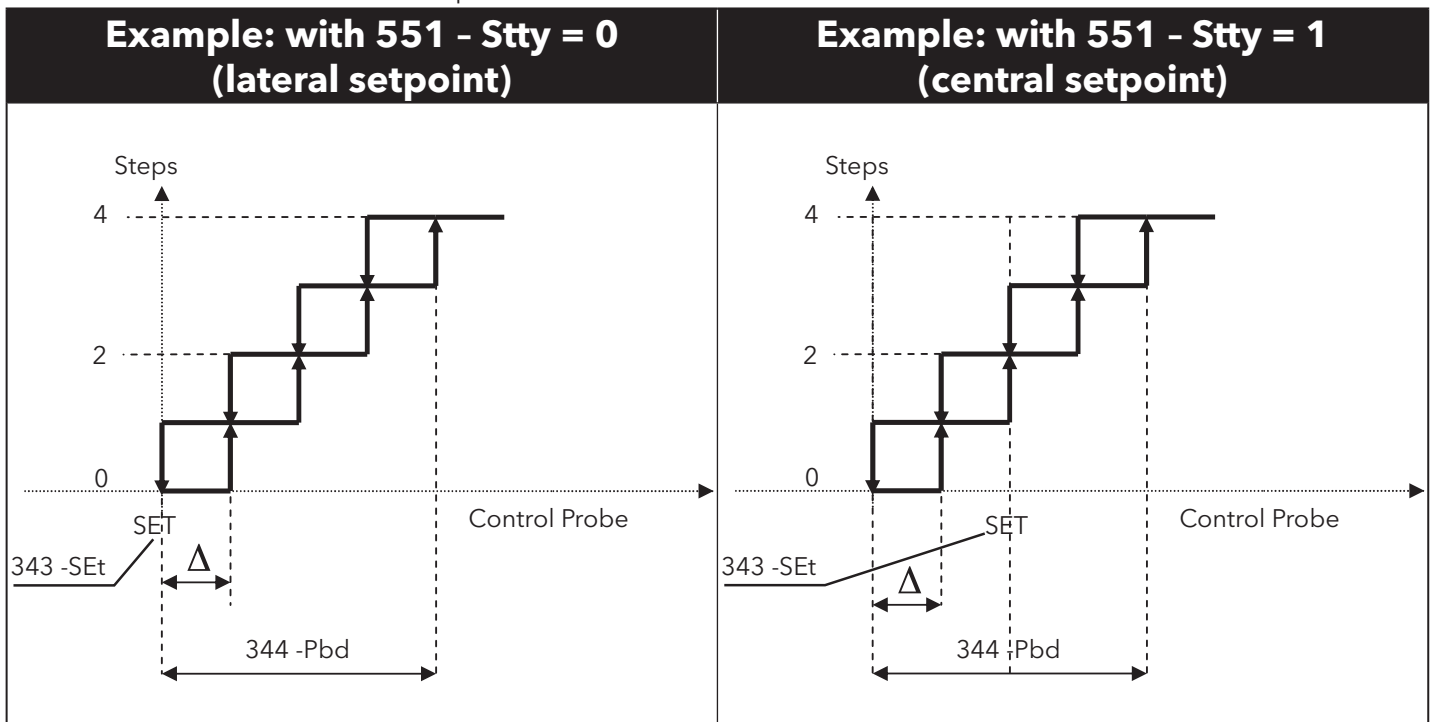

##### Enabling

##### 301 - FCFn = 0

The power request from the discharge regulator is proportional to the difference between the setpoint and the HP control probe.

##### Proportional band: Digital fans

The regulator activates a number of power steps to reach the Set Point set at parameter **343-SEt**. The number of resources needed is linked to the difference between the value measured by the HP control probe and the Set Point. Naturally, the greater the difference, the more resources needed to reach the Set Point. The temperature or pressure interval between one step and another is the functional value of the proportional band **344 - Pbd** and number of resources present.

$$\Delta = 344 - Pbd / 521 - nFn \text{ (number of fans)}$$

## Parameters

			Notes
<b>FANS Regulation Limits</b>	<b>343-SEt</b>	Discharge setpoint	
<b>FANS Regulation Limits</b>	<b>344 - Pbd</b>	Proportional discharge band	

### Proportional band: Digital Fans + INVERTER

The number of power steps is actuated on the basis of the difference between the value detected by the HP control probe and the Set Point, the power at which the continuously controlled fans is driven varies from 0% to 100% between the activation/deactivation of a power step.

After activating the last power step, the INVERTER continues to modulate between 0% and 100% in the section highlighted in the diagram before remaining ON outside the proportional band.

For HP control probe < Set Point, INVERTER at minimum.

### Example 4 digital fans + INVERTER

$$\Delta = 344 - Pbd / 521 - nFn \text{ (number of fans)}$$

In an INVERTER Error with the Quick Start parameter **520 - Fnty = 3** the continuous control fan will be driven by the activation/deactivation of a power step.

### Proportional band: INVERTER fan

NB: this applies in the case of a continuously controlled fan (or multiple fans connected in parallel)

## Example with 551 - S<sub>ty</sub> = 0 (lateral setpoint) and 303 - CoIE = 1 (enable cut-off)

### Parameters

Folder	Parameter	Description
FANS Regulation Limits	343-SEt	Discharge setpoint
FANS Regulation Limits	344 - Pbd	Proportional discharge band
FANS Regulation/Alarms	309-InLSP	minimum fan speed %.
FANS Regulation/Alarms	310-InMSP	maximum fan speed %.
FANS Regulation/Alarms	311-InSSP	fan saturation speed %.
FANS Regulation/Alarms	303 - CoIE	Enable cut-off INVERTER
FANS Regulation Limits	345 - Cod1	Delta 1 cut-off
FANS Regulation Limits	346 - Cod2	Delta 2 cut-off

#### minimum cut-off

fan speed goes from 0 to MIN when the HP control probe reaches 'A' from below;  
If the HP control probe reaches 'A' 'from above', the speed changes from MIN to 0.

#### saturation cut-off

fan speed goes from continuous control to MAX when the HP control probe reaches 'B'.  
If the HP control probe reaches 'B' 'from above', we have continuous control between MAX to MIN.

N.B.: with no cutoff by setting the **303 - CoIE = 0** parameter the graph is transformed losing the cutoff hysteresis

## 10.1.8.2 DEAD ZONE FAN REGULATION

### Enabling

#### 301 - FCFn = 1

Power requested by the discharge regulator is proportional to how long the HP control probe remains outside the proportional band.  
The proportional band is symmetrical to the setpoint value.

### Dead Zone Fan Parameters

Folder	Parameter	Description
FANS Regulation Limits	343-SEt	Discharge setpoint
FANS Regulation Limits	344 - Pbd	Proportional discharge band
FANS Safety Times	324-don	ON steps time Delay time between the calls of two different steps.
FANS Safety Times	325-doF	OFF steps time Delay time between switching off two different steps.

### Dead band: Digital fans

The main function of the regulator consists in activating a number of power steps in proportion to the time passing from when the HP control probe has exceeded the limit SET + BP/2.

The proportional band is symmetrical to the SET value.

When the HP control probe has exceeded the limit a new resource will be activated every **324 - don** seconds till the HP control probe returns into the semi-band. The same holds for resource deactivation every **325 - doF** seconds.

### Dead band: Digital Fans + INVERTER

Activation of a number of digital power steps is the same as the digital case, while continuous fan regulation is driven from 0% (SET - BP/2) and 100% (SET+BP/2) within the band.

With an INVERTER Error with the Quick Start parameter **520 - Fnty = 3** the continuous control regulator is driven by an additional digital step.

## Dead band: INVERTER

Operations are the same as that of digital fans: in this case you do not activate number of steps but discrete increments / decrements defined by 329-InPC.

With an INVERTER Error with 520 - Fnty = 3, regulation switches from continuous to digital as described in the section Digital Fans - Dead Band.

### 10.1.8.3 PID FAN REGULATION

#### Enabling

#### 301 - FCFn = 2

The power request from the discharge regulator is a function of the difference between the HP control probe and Set Point and is equal to the sum of three terms:

**P** proportional to error: considers the difference between value read by the LP control probe and the Set Point, entering an action that is directly proportional to it; the proportional component action decreases as the error approaches zero;

**I** proportional to the integral error: integrates the error detected over time, reducing the final difference from the Set Point; this function tracks previous control values, providing a corrective action able to add or remove power gradually to get closer to the Set Point value.

**D** proportional to the error derivative: considers the speed with which the control value varies in the process; this provides a faster response in system control, inasmuch as the correction is greater the greater the rate of change of the error;

The control signal applied to the actuator is thus:

$$P + I + D = K_p * (\text{error}) + K_i * (\text{error integral}) + K_d * (\text{error derivative})$$

$$K_p = 1000/B_p$$

$$K_i = K_p * T_c / T_i$$

$$K_d = K_p * T_d / T_c$$

#### Tc Application cycle time (1.0 sec)

You can set the following with parameters:

	Folder	Parameter	Description
Enabling	FANS Regulation/Alarms	304 - ItEn	enabling integral control =1
	FANS Regulation/Alarms	306 - PbEn	enabling proportional control =1
	FANS Regulation/Alarms	307 - dtEn	enabling derivative control =1
Values	FANS Regulation/Alarms	305 - It	integrative time constant value <b>Ti</b>
	FANS Regulation Limits	344 - Pbd	proportional band value <b>Bp</b>
	FANS Regulation/Alarms	308 - dt	derivative time constant value <b>Td</b>

The discrete control signal applied to the actuator is thus

#### PID: Digital fans

The control signal  $u(t)$  results in the activation of a number of power steps which is proportional to  $u(t)$  itself.

#### PID: INVERTER fan

The control signal  $u(t)$  represents the power actuated directly on the INVERTER.

With an INVERTER Error with **520 - Fnty = 5** the continuously controlled fan will be driven as described in the previous case

## 11. CONFIGURABLE REGULATOR

### 11.1. CONFIGURABLE REGULATOR AND CONFIGURABLE ALARM REGULATOR

EWCM EO manages a 'general purpose' regulator for heating and cooling of the ON/OFF or analogue type. An alarm regulator called alarm 'configurable regulator independent of the configurable regulator, that is it is not necessary to enable the latter for alarm operations.

The regulator controls 2 steps (heating/cooling), one step plus an analogue output or a step and a serial command through EEV Eliwell driver. Just the first step controls all options:

	step 1	step 2
<b>HEAT/COOL mode (heating/cooling)</b>	✓	✓
<b>digital output</b>	✓	✓
<b>analogue output</b>	✓	-
<b>V800/V910 driver</b>	✓	-

The regulator, with two independent intervention points, works on the basis of probe in temperature or on the difference between the discharge probe value (converted in temperature) and the value of a probe selected.

#### Typical examples

##### ON/OFF

- oil heating and cooling, using a probe immersed in the oil; possible cold gas injection on heads;
- oil heating (first step) + cooling (second step) for cold climates;
- cooling of low temperature compressor head (first step);
- cooling of ambients and/or control panels (using panel temperature probe);
- control of modulated pump for glycol plants

control of discharge gas sub-cooling (with fixed or floating set). Regulation by:

- fixed set:** on gas temperature output from sub-cooling exchanger or
- floating set:** on difference between discharge temperature and gas temperature output from sub-cooling exchanger.

##### Analogue

- fan activation

##### Electronic expansion valve

Activation of an electronic expansion valve

- Activation of the solenoid valve powering the thermostatic valve, through relay output;
- Activation of EEV driver (impulse or stepper) through relay output (using third party drivers) or via serial port '**RS485 EXP**' (using an Eliwell V910 or V800 driver);

##### Parameters

The menu contains a folder with configurable regulator parameters and for the configurable alarm regulator

GENERAL REGULATOR		
REGULATOR CONFIGURABLE	<b>710-MPCFR</b>	Configurable regulator probe mode <b>0</b> =disabled; <b>1</b> =probe selected; <b>2</b> =difference between probe selected and discharge probe;
	<b>711-MCFr1</b>	Configurable regulator mode step 1 <b>0</b> =Cooling; <b>1</b> =Heating;
	<b>712-MCFr2</b>	Configurable regulator mode step 2 <b>0</b> =Cooling; <b>1</b> =Heating;
	<b>713-SEtCFR1</b>	Configurable regulator setpoint step 1
	<b>714-SEtCFR2</b>	Configurable regulator setpoint step 2
	<b>715-dCFr1</b>	Configurable regulator delta step 1
	<b>716-dCFr2</b>	Configurable regulator delta step 2
	<b>717-PbdCFr1</b>	Proportional band step 1
	<b>718-CodCFR1</b>	Delta cut-off step 1
	<b>719-CFr1dly</b>	Configurable regulator delay step 1
	<b>720-CFr2dly</b>	Configurable regulator delay step 2
	<b>721-CFrL1</b>	% minimum step 1
	<b>722-CFrM1</b>	% maximum step 1
	<b>723-CFrS1</b>	% saturation step 1
ALARM REGULATOR CONFIGURABLE	<b>724-ECFAw</b>	Enable warning <b>0</b> =Disabled; <b>1</b> =Enabled;
	<b>725-CFAty</b>	Configurable alarm mode <b>0</b> =Minimum; <b>1</b> =Maximum;
	<b>726-SEtwCFA</b>	Configurable alarm warning threshold
	<b>727-SEtCFA</b>	Configurable alarm setpoint
	<b>728-dCFA</b>	Configurable alarm differential

## Enabling

### PARAMETERS > GENERAL REGULATOR > 710-MPCFR ≠ 0

Configuration of parameters to control mode and outputs:

		step 1		step 2
<b>HEAT/COOL mode (heating/cooling)</b>	✓	<b>711-MCFr1 = 0 COOL</b> <b>711-MCFr1 = 1 HEAT</b>	✓	<b>712-MCFr2 = 0 COOL</b> <b>712-MCFr2 = 1 HEAT</b>
<b>digital output</b>	✓	<b>±94</b> <b>digital output</b> <b>configurable regulator step 1</b>	✓	<b>±95</b> <b>digital output</b> <b>configurable regulator</b> <b>step 2</b>
<b>analogue output</b>	✓	<b>631-H501=4 or</b> <b>632-H502=4 or</b> <b>(only 9990) 633-H503=4 or</b> <b>EXTERNAL DRIVER &gt;740 - EEvE=2</b> <b>(CO2)</b>	-	-
<b>V800/V910 driver</b>	✓		-	-

Based on configuration of parameters the regulator can control all ON/OFF modes in parallel, band or EEV driver

### 11.1.1. CONFIGURABLE REGULATOR ON/OFF

For each of the steps, COOL or HEAT can be selected with the parameters

**711-MCFr1** and **712-MCFr2**

Each step has its own fixed and differential set

## 11.1.2. PROPORTIONAL BAND REGULATION

Band regulation is only with step 1

With an analogue output you can set the proportional band **717-PbdCFr1** and minimum actuation percentages **721-CFrL1** maximum **722-CFrM1** and saturation **723-CFrS1**.

The differential (return hysteresis) will be **718-CodCFr1**. Setting the differential to zero the step is disabled.

A minimum stay time can be set for each step (regulator on) with delay parameters:

**719-CFr1dly** regulator 1

**720-CFr2dly** regulator 2 (just digital output)

before activating the function associated to the step.

Return occurs immediately, as soon as the regulator is deactivated.

If the control probe is in error, regulation is disabled.

## 11.1.3. CONFIGURABLE REGULATOR ALARM

The configurable regulator alarm uses a temperature probe that can be selected from amongst those listed below

### Probes

Analogue inputs to be configured are one or more amongst **PB5 PB6 PB7 PB8**

If the control probe is in error, regulation is disabled.

### CONFIGURABLE REGULATOR ALARM

**ANALOGUE INPUT** > configure an analogue input =10

### CONFIGURABLE ALARM REGULATOR + CONFIGURABLE REGULATOR

**ANALOGUE INPUT** > configure an analogue input =9

In this case, regulators are correlated: the same probe is configured for both alarm and configurable regulator

N.B.:

If you want to use two separate probes, configure as follows:

### CONFIGURABLE REGULATOR

**ANALOGUE INPUT** > configure an analogue input =8

### CONFIGURABLE REGULATOR ALARM

**ANALOGUE INPUT** > configure an analogue input =10

To summarise:

	probe configuration	Notes
<b>Configurable REGULATOR</b>	<b>8</b>	<b>separate probes</b>
<b>Configurable regulator alarm</b>	<b>10</b>	
<b>Configurable regulator alarm + Configurable REGULATOR</b>	<b>9</b>	<b>single probe</b>

Alarms have two intervention limits, a 'warning' (signal) and the alarm itself both configurable  
 The warning can be enabled or not through **724-ECFAw** (0=Disabled; 1=Enabled)  
 The minimum or maximum alarm is configurable through **725-CFA<sub>ty</sub>** **0**=Minimum; **1**=Maximum

## 12. EEV DRIVER

### 11.2. EEV DRIVER V910/ V800

EWCM EO manages an electronic expansion valve (EEV) using the serial **RS485 EXP**

Here below is a connection diagram between EWCM EO and driver V910 for stepper valves

Here below is a connection diagram between EWCM EO and driver V800 for impulse valves

The parameters for configuring serial communication are:

Folder	Parameter	Description	Values
ADDRESSING	676 - PtSEXP	Protocol selection RS485 EXP	3= Modbus RTU
ADDRESSING	677 - bdrEXP	Baud rate RS485 EXP.	1=19200
ADDRESSING	678 - PtyEXP	Parity bit RS485 EXP	2=EVEN (parity)
ADDRESSING	679 - datEXP	RS485 EXP data bit.	0=7 data bit; 1=8 data bit;

**NOTE.**

Factory settings to manage **RS485 EXP** serial with **EEV V910/V800 driver shall NOT be changed**

**Parameters**

The menu contains a dedicated folder with parameters and for the external driver

EXTERNAL DRIVER	
740 - EEvE	Enable EEV. Enable electronic valve driver 0=disabled; 1=step 1; 2=CO2;
741 - drMMT	Delay activation high temperature central (MT) at minimum power
742 - dCOOnLT	Delay activation compressor after high temperature central (MT) consent

**Enabling**

Electronic valve is enabled through parameter **740 - EEvE ≠ 0**

Driver present if **740 - EEvE = 1,2**

**EXTERNAL DRIVER > 740 - EEvE = 1 → step.** We advise using driver V800 (for impulse valve)<sup>1</sup>

The driver is associated to the 'general purpose' regulator for sub-cooling

The configurable regulator controls a step and a serial command by driver for EEV Eliwell.

Just the first step controls this option

**EXTERNAL DRIVER > 740 - EEvE = 1 → step1 / 740 - EEvE = 2 CO2.** We advise using driver V910 (for stepper valve)

The driver controls exchangers for systems in cascade

	step 1	CO2
digital output	✓	
analogue output	✓	
EEV driver	V 800 V910	V910

Case **740 - EEvE = 1,2** the Service Menu displays the EEV folder<sup>2</sup>

Through the RS485 EWCM EO serial port it will carry out

- EEV driver activation/deactivation
- read alarm status

1 driver V910 can also be used for stepper valves

2 see EEV Service Menu Appendix

## 11.2.1. SUB-CRITICAL CO<sub>2</sub> SYSTEMS

### Operation

Request to activate the CO<sub>2</sub> system (low)

- the V910 exchanger valve is enabled
- after a delay **741 - drMMT** the HP plant (high) operates at minimum power
- on confirmation that the HP plant has been activated, after a further delay **742 - drCO<sub>n</sub>LT** the CO<sub>2</sub> system (low) activates its compressors

The V910 driver will be switched off after a delay **741 - drMMT** from the CO<sub>2</sub> system (low) being switched off

There are 3 cases based on activation of the HP system

The two systems can be managed by serial port or suitable configuration of digital inputs and outputs

system	serial	digital inputs	digital output
high HP	input: receives command to activate at minimum	±95 minimum activation high system (MT)	±96 power state > 0% high system (MT)
low CO2	input: receives operation status HP system	±96 reception of power state > 0% high system (MT)	±97 command for minimum activation for high plant (MT)

The low system (CO2) will block, or will not start, its compressors if:

- The high system is not supplying power (system OFF, plant blocked, etc);
- The V910 driver is blocked (alarm)
- There is no communication between EWCM EO and V910 with serial connection

The low system (CO2) block must occur immediately deactivating all resources without respecting safety times.

### Applications<sup>[3]</sup>

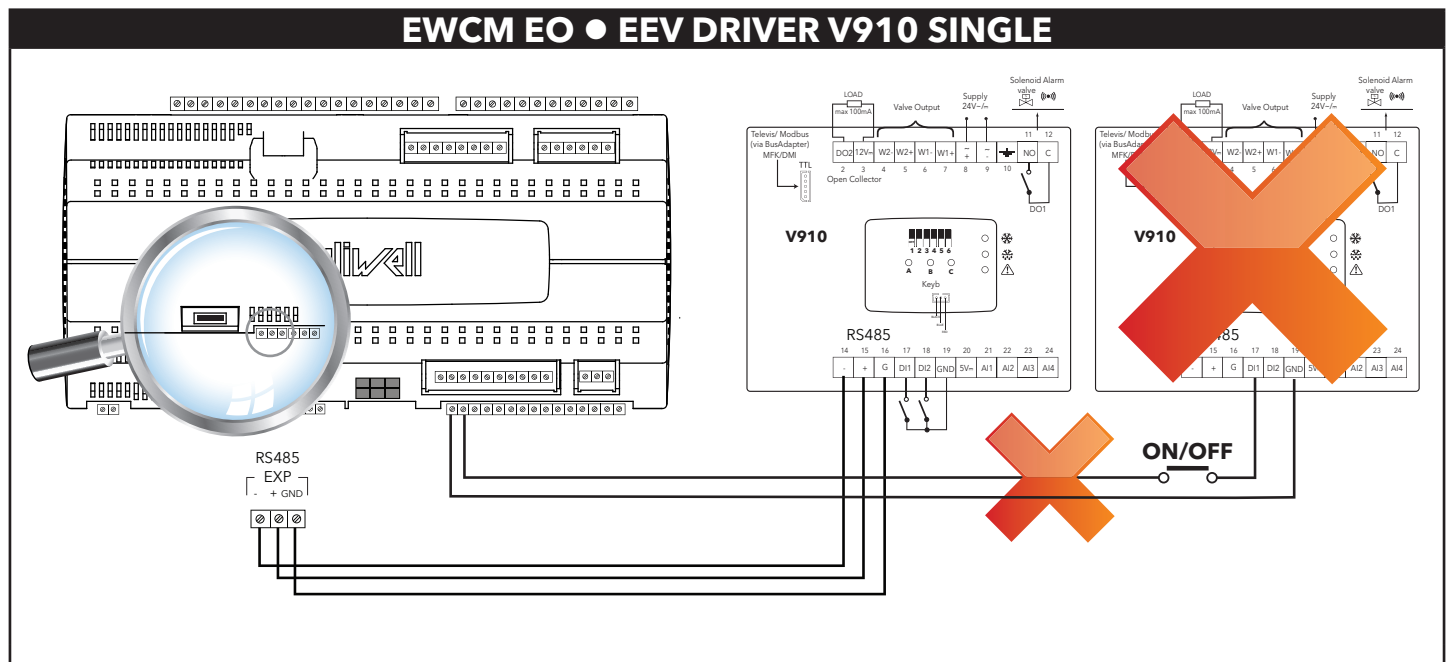

The valve driver can also be controlled by a suitably configured relay.

There are 2 cases

1. 1 driver commanded by serial
2. 1 or 2 drivers commanded by relay

2 drivers commanded by serial or 1 driver commanded by serial + 1 by relay (mixed) is not allowed.

EWCM EO manages a single V910 driver connected via serial

The use of 2 V910 drivers is foreseen exploiting digital inputs

## EWCM EO • 2 x EEV DRIVER V910 with DIGITAL

An application example is illustrated above where 2 exchangers are used in parallel. EWCM EO manages commands via digital for:

- enabling
- feedback
- external alarm

## ACCESS TO PARAMETERS

	<table border="1"> <tr> <td>MENU</td> <td>02/02</td> </tr> <tr> <td>Functions</td> <td></td> </tr> <tr> <td><b>Parameters</b></td> <td></td> </tr> </table>	MENU	02/02	Functions		<b>Parameters</b>		<table border="1"> <tr> <td>PARAM</td> <td>01/01</td> </tr> <tr> <td><b>User</b></td> <td></td> </tr> <tr> <td>Installer</td> <td></td> </tr> </table>	PARAM	01/01	<b>User</b>		Installer		<b>USER</b>

### PASSWORD

The password is composed of 5 alphanumeric characters.

**DEFAULT PASSWORD > \*\*\*\*\* > direct access to parameters**

**ACCESS PASSWORD >** the label **PASSWORD** appears

press the 'OK' key and set the password with the 'UP' and 'DOWN' keys.  
If the password is correct, pressing 'OK' opens the parameters Menu.

### ACCESS AND STRUCTURE OF THE PARAMETERS<sup>(1)</sup>

- Select the Quick Start folder with 'UP' and 'DOWN' and press 'OK'
- display sub-folders (Compressors case): with 'UP' and 'DOWN' keys and press 'OK' to access the parameters display itself
- display of parameters themselves.

After entering the selected folder (example Display folder) EWCM EO will show in the heading the name of the folder in lower case followed by two numbers that identify the number of the parameter / total number of the parameters in the folder (example 001/010 indicates the first parameter of 10 parameters in the Display folder). This will be followed by the parameter acronym preceded by an univocal number identifying the parameter itself (e.g. 541 - LAng, the first in the list)

### Display and modification of parameters

To scroll parameters press 'UP' or 'DOWN' arrow keys; to modify the value press 'OK'; to modify the value press 'UP' or 'DOWN' again; to confirm the parameter value press 'OK' again.  
Press the 'SX' key to exit parameter editing.

<sup>1</sup> Access and use of Quick Start parameters is described in section '5. assisted configuration' page 28

## PARAMETERS TABLE KEY

EWCM EO foresees a group of parameters representing the same variable in different units of measurement. Parameters are duplicated / quadrupled depending on the Unit of Measurement shown on the display.

### Pressure/Temperature Parameters

Parameters quadrupled [°C, bar; °F, PSI] based on Unit of Measurement displayed

For example the parameter of folder **Compressors > Regulation Limits > 141 - LSE** is displayed as:

DESCRIPTION	RANGE	DEFAULT	M.U.
<b>141 - LSE</b> minimum setpoint °C.	-100...600	<b>-55.0</b>	°C
<b>141 - LSE</b> minimum setpoint °F.	-150...999.9	-67	°F
<b>141 - LSE</b> minimum setpoint bar.	-1...68	0.62	bar
<b>141 - LSE</b> minimum setpoint PSI.	-14.5...999.9	8.9	PSI

In the table the parameter is indicated once only (single line) with range, default, and UM in °C with the symbol §

### Temperature Parameters

Parameters duplicated [°C; °F,] based on Unit of Measurement displayed

For example the parameter of folder **Compressors > Regulation Limits > 155 - AtdS** is displayed as:

DESCRIPTION	RANGE	DEFAULT	M.U.
<b>155 - AtdS</b> Ambient temperature dynamic set °C	-100...600	<b>15.0</b>	°C
<b>155 - AtdS</b> Ambient temperature dynamic set °F	-150...999.9	59	°F

In the table the parameter is indicated once only (single line) with range, default, and UM in °C with the symbol °

To display range in other UM see '4.4.4. UNIT OF MEASUREMENT' page 27 or use Device Manager

### Values read by probe or pressure transducers

NOTE: ALL values in **bar / PSI** are expressed in **ABSOLUTE PRESSURE** and depend on parameter **DISPLAY > 543- rELP**.

Except for Calibrations and Limits:

### CALIBRATIONS > PB1 and PB2 ALWAYS AN ABSOLUTE VALUE (ABSOLUTE BAR)

Note that each parameter can be given a double calibration depending on the Unit of Measurement. The calibration is significant when analogue inputs are configured as Digital.

Parameters quadrupled [°C, bar; °F, PSI] based on Unit of Measurement displayed

In the table the parameter is indicated once only (single line)

transducers			temperature probes			
PB1	PB2	EWCM9900 PB3	PB5	PB6	PB7	PB8
<b>655-CALb1</b>	<b>656-CALb2</b>	<b>657-CALb3</b>	<b>660-CALPb5</b>	<b>661-CALPb6</b>	<b>661-CALPb7</b>	<b>660-CALPb8</b>
bar/PSI	bar/PSI	bar/PSI	-	-	-	-
-	-	-	°C/°F	°C/°F	°C/°F	°C/°F

### LIMITS > ALWAYS IN ABSOLUTE VALUES (ABSOLUTE BAR)

Parameters duplicated [bar; PSI] based on Unit of Measurement displayed

In the table the parameter is indicated on 2 separate lines:

transducers					
lower threshold PB1	upper threshold PB1.	lower threshold PB2	upper threshold PB2.	EWCM9900 lower threshold PB3	EWCM9900 upper threshold PB3.
<b>663-LtPb1</b>	<b>664-UtPb1</b>	<b>665-LtPb2</b>	<b>666-UtPb2</b>	<b>667-LtPb3</b>	<b>668-UtPb3</b>
bar	bar	bar	bar	bar	bar
PSI	PSI	PSI	PSI	PSI	PSI

## 13.1. PARAMETER TABLES

### 13.1.1. QUICK START PARAMETERS TABLE

Access and use of Quick Start parameters is described in section '5. assisted configuration' page 28

PAR.	DESCRIPTION	RANGE	DEFAULT	M.U.	8900	9100	9900
<b>🔧 QUICKSTART</b>							
<b>501-tyPE</b>	Type of plant <b>0</b> = compressor rack of standard type <b>1</b> = common discharge single discharge compressor racks <b>2</b> = chiller. The same as case 0. In this case regulation is in temperature (referred to water) N.B.: If <b>501 - tyPE = 1</b> the parameters if the folder <b>Compressors [2]</b> will be visible	0 ... 2	0	num	●	●	●
<b>502-PC1</b>	Compressor 1 power or number of compressor 1 steps	1 ... 255	1	num			
<b>503-PC2</b>	Compressor 2 power or number of compressor 2 steps	1 ... 255	1	num			
<b>504-PC3</b>	Compressor 3 power or number of compressor 3 steps	1 ... 255	1	num			
<b>505-PC4</b>	Compressor 4 power or number of compressor 4 steps	1 ... 255	1	num			
<b>506-PC5</b>	Compressor 5 power or number of compressor 5 steps	1 ... 255	1	num

## 14. ALARMS

### 14.1. ALARMS

The EWCM device is able to perform complete diagnostics of the system signalling any operating problems with specific alarms, to signal specific events on LCD display and via LED, defined by the user to have greater control over the system.

Alarms are always indicated with the red Alarm LED on the keyboard. The alarm is also indicated by activation of the corresponding alarm relay if configured.

The alarms can be of 3 types:

#### **Automatic Alarm > AUTO**

Alarm active if the cause of the alarm is present, otherwise not.

#### **Manual alarm >**

Alarm active if the cause of the alarm is present, otherwise Resettable from the alarms menu.

#### **Semi-automatic alarm (by time or events)>**

Behaves like an automatic alarm so long as the number of events in the unit of time is less than a number set in a parameter, otherwise like a manual alarm.

#### **ALARM ACKNOWLEDGEMENT**

Alarms can be acknowledged in the Main Display by pressing key F3 once (see Keys and Components section)<sup>1</sup>. The alarm LED flashes.

The relay configured as an alarm relay will be deactivated.

**Acknowledgement duration** parameter

**SAFETY MEASURES > 568-Aro.**

If **SAFETY MEASURES > 568-Aro=0** mute is not enabled.

With new alarms/probe errors, the LED changes from flashing to steady on and the alarm relay is reactivated.

If during the acknowledgement period all alarms automatically reset, the LED turns off and the alarm relay is deactivated.

If at the end of the acknowledgement period there is at least one active alarm, the alarm relay is re-activated and the alarm LED turns on again.

<sup>1</sup> or from function menu **Mute**

### 14.1.1. ENABLING ALARMS

In general all alarms and probe errors are immediately controlled from when the machine is switched on, if enabled. The LP/HP control probe maximum and minimum alarms are distinguished inasmuch as they are controlled, if enabled, after 566-PAo time from the device being switched on.

**ALARM AND ERROR PROBE > immediate management if enabled**

**MAXIMUM AND MINIMUM ALARMS > SAFETY MEASURES > 566-PAo**

### 14.1.2. MANAGING ALARMS

Each alarm can be managed singly and configured by parameter:

**SAFETY MEASURES > 569-PrSAE**

Values attributable to alarm parameters 569-PrSAE...701-HPPAE

Management suction pressure switch HPr/LPr alarm.

**0= disabled** Disables alarm management;

**1= warning** Enables alarm warning only;

**2= alarm** Enables warning and any action on regulators;

**3= alarm + relay** Enables warning, any actions on regulators and activating a relay for blocking alarm;

Parameter	Managing alarm	Values
570-PSAE	Suction HP/LP Alarm.	<b>569-PrSAE</b>
571-gtSAE	Refrigerant Level alarm.	
572-gLSAE	Refrigerant Leak alarm.	
573-PrdAE	Discharge HPr/LPr alarm.	
574-PdAE	Discharge HP/LP Alarm.	
575-FtAE	Fan thermal switch alarm	
576-FInAE	Fan inverter error alarm	
577-SFAE	Fan maintenance alarm.	
578-CSAE	Compressor block alarm.	
579-CInAE	Compressor inverter error alarm.	
580-SCAE	Compressor maintenance alarm.	
581-oLAE	Oil level alarm.	
582-gAAE	General alarm	
583-rtCAE	RTC Alarm.	
701-HPPAE	HP prevention alarm management.	0=Disables alarm management; 1=Only enables alarm warning;
702-CFAE	configurable regulator.	<b>569-PrSAE</b>
703-COAE	HP/LP/TH/PD compressor alarm management.	
704-gtSd	Refrigerant level alarm message delay	0...999 sec

Management of probe errors always enabled is an exception.

Access to the Alarms Menu takes place via the Main Display by pressing and holding down the function key F3. if there are no active alarms/probe errors, the display will read EMPTY.

#### SAFETY RELAY

The safety relay digital output is activated when the board is powered up.

It is deactivated when the board is powered down.

The actuation of the safety relay depends on correct allocation of the output itself.

#### BLOCKING ALARM RELAY

This relay is activated if at least one of 569-PrSAE...701-HPPAE parameters

is set to 3 and the corresponding alarm is on.

Relay actuation depends on correct allocation of the output itself.

### 14.1.3. ALARM HISTORY

#### ENABLING >> FUNCTIONS > 555-HIEn = 1

The history contains a maximum of 50 alarms. A new alarm, after this limit is reached, will result in the loss of the oldest alarm data.

When a new alarm is activated it is entered in the history immediately. This does not apply to automatic pressure switch alarms which are only notified on the display.

If the alarm is already present in the history and occurred in the same hour, its hourly frequency is increased. The maximum value of hourly frequency is 99.

Each alarm is represented as follows:

- nn Exyzw-hh-dd/mm/yy-ff

- -nn Alarm no. [1...50]
- Exyzw: 'E' followed by alarm code (xy) and system index (zw)
- hh: Time of activation
- dd/mm/yy: Date of activation
- ff: Hourly frequency - the number of times the alarm has occurred in an hour (max. 99)

Example: E0102-13-12/06/12-02

Alarm 0102 at 13:00 on 12 June 2012; 2 activations in the hour

Alarms list	Alarm code (xy)	System index (zw)	Notes
LP suction pressure switch trip alarm (manual)	00	01...02	01 circuit 1 02 circuit 2
HP suction pressure switch trip alarm (manual)	01	01...02	
Maximum suction probe alarm	02	01...02	
Minimum suction probe alarm	03	01...02	
Refrigerant level alarm	04	00	
Refrigerant leak alarm	05	00	
LP discharge pressure switch alarm (manual)	06	00	
HP discharge pressure switch alarm (manual)	07	00	
Discharge probe maximum alarm	08	00	
Discharge probe minimum alarm	09	00	
Digital fan thermal switch alarm	10	01...08	01 digital fan 1 ... 08 digital fan 8
Continuous control fan thermal switch alarm	11	00	
Fan inverter error alarm	12	00	
Digital fan 1 maintenance alarm	13	01...08	01 digital fan 1 ... 08 digital fan 8
Continuous control fan maintenance alarm	14	00	
Compressor oil differential pressure alarm	15	01...02	01 circuit 1 02 circuit 2
HP compressor alarm	16	01...02	
LP compressor alarm	17	01...02	
Compressor thermal switch alarm	18	01...02	
Compressor maintenance alarm	19	01...12	01 compressor 1 ... 12 compressor 12
Compressor inverter block alarm	20	01...02	01 circuit 1 02 circuit 2
Compressor inverter maintenance alarm	21	01...02	

Alarms list	Alarm code (xy)	System index (zw)	Notes
Compressor block alarm	22	01	01 compressor 1 ... 12 compressor 12
Compressor inverter error alarm	23	01...02	01 circuit 1 02 circuit 2
Compressor lubricant oil level alarm	24	01...02	
General system alarm	25	00	
Internal ambient temperature alarm	26	00	
Suction gas probe error alarm	27	01...02	01 circuit 1 02 circuit 2
Discharge gas probe error alarm	28	00	
External ambient temperature alarm	29	00	
Recovery water temperature alarm	30	00	
Sub-cooling temperature alarm	31	00	
Error opening recordings file	32	00	
Error writing recordings file	33	00	
Error closing recordings file	34	00	
Recordings memory full error	35	00	
IO Configuration Error	36	00	
EEPROM Bios error <b>(Warning)</b>	37	00	
EEPROM User error <b>(Warning)</b>	38	00	
RTC batt exhausted	39	00	
RTC connection error	40	00	
RTC Value Error	41	00	
Discharge HP alarm prevention timeout	42	00	
Configurable regulator warning	43	0	
Configurable regulator alarm	44	0	
Configurable regulator probe error	45	0	
Configurable alarm regulator probe error	46	0	

## UPLOADING THE ALARMS HISTORY

See USB Copy Card chapter

## 14.1.4. DISCHARGE HP ALARM PREVENTION

The discharge HP alarm is prevented by limiting the number of resources that the suction regulator would normally require to activate when the HP control probe value is close to the alarm activation threshold.

### ENABLING >> FANS > Regulation Alarms > 318-HPPE = 1

This prevention algorithm is based on the definition of two HP control probe thresholds definable in absolute or relative mode based on parameter **DISPLAY > 544-Abs**:

Minimum/maximum Alarms absolute/relative	Threshold 1 WARNING	Threshold 2 POWER REDUCTION
<b>ASSOLUTE (abs)</b> <b>DISPLAY &gt; 544-Abs = 0</b>	<b>FANS &gt; Regulation Thresholds&gt;</b> <b>350-HPP1</b>	<b>FANS &gt; Regulation Thresholds&gt;</b> <b>351-HPP2</b>
<b>RELATIVE (rel)</b> <b>DISPLAY &gt; 544-Abs = 1</b>	<b>FANS &gt; Regulation Thresholds&gt;</b> <b>343-SEt</b> + <b>FANS &gt; Regulation Thresholds&gt;</b> <b>350-HPP1</b>	<b>FANS &gt; Regulation Thresholds&gt;</b> <b>343-SEt</b> + <b>FANS &gt; Regulation Thresholds&gt;</b> <b>351-HPP2</b>

#### → **limit 1 exceeded (WARNING)**

When the value read by the HP control probe exceeds **limit 1**, resources can no longer be activated by the suction controller.

The power delivered can therefore only decrease in accordance with requests made by the temperature controller.

#### →← **limit 1 - limit 2 interval**

New resources will NOT be activated in this interval.

#### → **limit 2 exceeded (POWER REDUCTION)**

The maximum power percentage implemented will be defined by parameter **319-HPPP**.

Example 1:

- Compressor rack power 80%,
- **319-HPPP** = 50%.

The resources will be deactivated to supply power at the maximum implemented percentage of 50%.

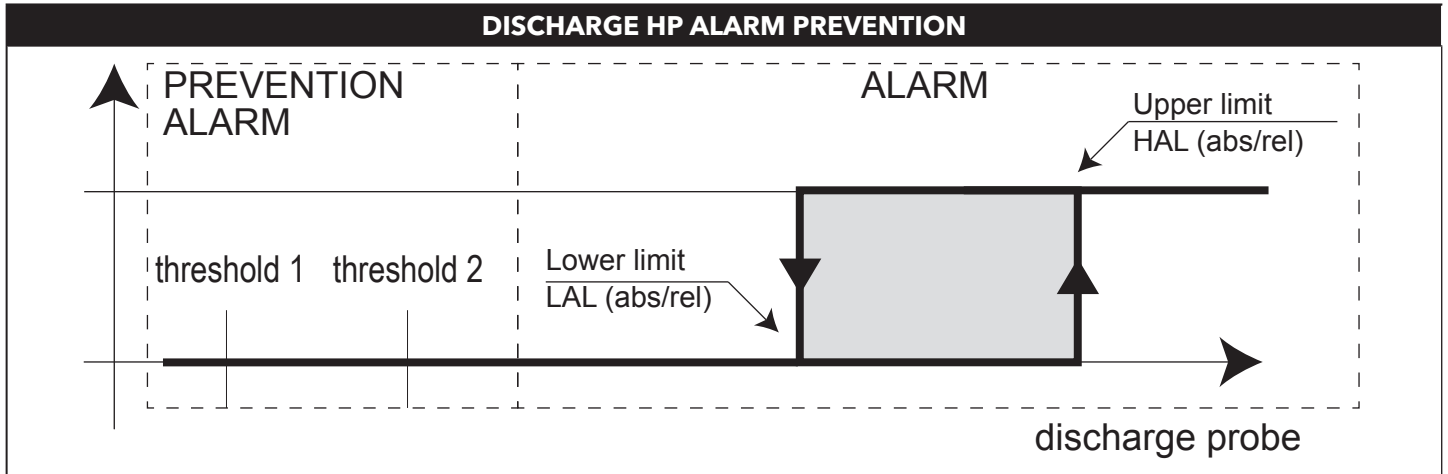

Example 2:

- Compressor rack power 30%,
- **319-HPPP** = 50%.

The power supplied remains at the maximum implemented percentage of 30%.

#### ← **values under limit 1 (reset)**

For values under **limit 1** the suction controller resumes normal control.

### User parameters

The parameters that manage the discharge alarm prevention regulator are:

Folder	Label	Description
FANS Regulation Thresholds	350-HPP1	Threshold 1 absolute or relative discharge HP alarm prevention.
FANS Regulation Thresholds	351-HPP2	Threshold 2 absolute or relative discharge HP alarm prevention.
FANS Regulation/Alarms	318-HPPE	Enable discharge HP alarm prevention <b>0=No; 1=Yes</b>
FANS Regulation/Alarms	319-HPPP	% Power HP alarm prevention
FANS Regulation/Alarms	320-HPPd	Maximum duration of discharge HP alarm prevention. If <b>0</b> = output disabled for timeout
FANS Regulation/Alarms	321-HPPI	Minimum interval between discharge HP alarm preventions.
SAFETY MEASURES	701-HPPAE	HP alarm prevention timeout discharge management. <b>0</b> =Disables alarm management; <b>1</b> =Enables only the alarm warning

#### 14.1.4.1 DISCHARGE HIGH PREVENTION REGULATION WHEN LIMIT 2 IS EXCEEDED

##### HOMOGENEOUS STEPS, HOMOGENEOUS STEPS + INVERTER, INVERTER

The maximum power percentage implemented will be defined by parameter **319-HPPP**.

##### NON-HOMOGENEOUS STEPS

The system will attempt to guarantee a power as close as possible in excess relating to that requested by parameter **319-HPPP**, in line with the resources available at the time of the decision.

Resource deactivation takes place in accordance with the compressor safety times.

##### SAFETY MEASURES

Parameter **320-HPPd**, if not 0, defines the maximum duration of the prevention algorithm.

When the algorithm remains active for longer than **320-HPPd** (counted from when **limit 1** is exceeded), the algorithm is disabled for the time set in parameter **321-HPPI**.

If enabled by parameter **701-HPPAE**, the alarm message "HP Prevent. Timeout".

Once delay **321-HPPI** has elapsed and, if the conditions exist, the discharge high alarm prevention can be reactivated.

The alarm automatically resets when the HP control probe value drops below **limit 1** and the algorithm was active.

The control of the algorithm timeout output is not active if **320-HPPd=0**.

If the HP control probe is in error, management of this algorithm is not enabled.

## 14.2. ALARMS TABLES

### KEY

**C1** > circuit 1, **C2** > circuit 2

**LP** > suction, **HP** > discharge

Automatic Alarm > **AUTO**

Manual alarm > 

Semi-automatic alarm (by time or events) > 

### 14.2.1. UTILITIES ALARMS TABLE

#### 14.2.2.1 ANALOGUE/DIGITAL alarms details

##### LP Suction Pressure Switch

**Activation setpoint** LP regulation probe  $\leq$  [133-SEt]

**Hysteresis** -

**Reset** 111 - PEn (time window)  
112 - PEI (no. operations)  
Automatic if no. events in time window  $\leq$  PEn  
if  $>$ PEn manual.

If Pen=0 always automatic

**NB.** The bypass is loaded at every power variation applied to the plant not due to the alarm itself.  
In case of suction probe error, a minimum alarm is always notified

##### HP Suction Pressure Switch

**Activation setpoint** LP regulation probe  $>$  [133-SEt]

**Hysteresis** -

**Reset** 111 - PEn (time window)  
112 - PEI (no. operations)  
Automatic if no. events in time window  $\leq$  PEn  
if  $>$ PEn manual.

If PEN=0 always automatic

**NB.** The bypass is loaded at every power variation applied to the plant not due to the alarm itself.  
In case of suction probe error, a minimum alarm is always notified

##### LP suction probe

**Activation setpoint** 149 - LAL

**Hysteresis** 148 - dLAL

**Reset** -

**NB.** Alarm bypassed at power-on for time 566 - Pao.  
Alarm disabled in case of suction probe error  
Bypass 567 - tAo loaded when activation limit exceeded  
Activation setpoint relative to setpoint if 544 - AbS=1 (149 - LAL is subtracted from setpoint)

##### HP suction probe

**Activation setpoint** 151 - HAL

**Hysteresis** 150 - dHAL

**Reset** -

**NB.** Alarm bypassed at power-on for time 566 - Pao.  
Alarm disabled in case of suction probe error  
Bypass 567 - tAo loaded when activation limit exceeded  
Activation setpoint relative to setpoint if 544 - AbS=1 (setpoint is added to 151 - HAL)

##### LP Discharge Pressure Switch

**Activation setpoint** HP regulation probe  $\leq$  [233-SEt]

**Hysteresis** -

**Reset** 315 - PEn (time window)  
316 - PEI (no. operations)  
Automatic if no. events in time window  $\leq$  PEn  
if  $>$ PEn manual.

If Pen=0 always automatic

**NB.** The bypass is loaded at every power variation applied to the plant not due to the alarm itself.  
With a suction probe error the alarm is always minimum

### HP Discharge Pressure Switch

**Activation setpoint** HP regulation probe > [233-SEt]

**Hysteresis** -

**Reset** 315 - PEn (time window)

316 - PEI (no. operations)

Automatic if no. events in time window  $\leq$  PEn

if >PEn manual.

If PEn=0 always automatic

**NB.** The bypass is loaded at every power variation applied to the plant not due to the alarm itself.  
With a suction probe error the alarm is always minimum

### Discharge probe minimum

**Activation setpoint** 354 - LAL

**Hysteresis** 353 - dLAL

**Reset** -

**NB.** Alarm bypassed at power-on for time 566 - PAo.

Alarm disabled in case of discharge probe error

Bypass 567 - tAo loaded when activation limit exceeded

Activation setpoint relative to setpoint if 544 - AbS=1 (354 - LAL is subtracted from setpoint)

### Discharge probe maximum

**Activation setpoint** 348 - HAL

**Hysteresis** 347 - dHAL

**Reset** -

**NB.** Alarm bypassed at power-on for time 566 - PAo.

Alarm disabled in case of discharge probe error

Bypass 567 - tAo loaded when activation limit exceeded

Activation setpoint relative to setpoint if 544 - AbS=1 (setpoint is added to 348 - HAL)

### 14.2.3. PROBES ALARMS TABLE

The probe errors / generic errors are all **AUTOMATIC**.

Display	Cause	Effect (°)	Description Solution
<b>Generic alarm Plant</b>	Activate digital input Generic alarm	vedi 582 - gAAE	Generic alarm 582 - gAAE

## 15. MODBUS MSK 504 FUNCTIONS AND RESOURCES

Modbus is a client/server protocol for communication between devices connected in a network. Modbus devices communicate using a **MASTER-SLAVE** technique where just one device (**MASTER**) can send messages. The other devices in the (**SLAVE**) network respond, returning the data requested by the master or executing the action contained in the message sent.

**MASTER** > The master device can send messages to individual slaves or to the entire network (broadcast) whilst slaves can only respond individually to the master, or to the entire network (broadcast), while slave devices only respond to messages singly to the master.

**SLAVE** > a device connected to a network that processes information and sends the results to the master using the Modbus protocol.

**RTU** > The Modbus standard used by Eliwell uses **RTU** coding to transmit data.

### 15.1. DATA FORMAT (RTU)

The coding model used defines the structure of messages transmitted on the network and the way in which this information is deciphered. The type of coding is usually selected on the basis of specific parameters (baud rate, parity, etc.). Furthermore, some devices support only specific coding models, although it must be the same one for all devices connected in a Modbus network.

The protocol uses the RTU binary method with bytes configured as follows:

**DATA BIT** > 8 BIT FOR DATA,

**PARITY BIT** > **NONE PARITY BIT (CONFIGURABLE)**

**STOP BIT** > 2 BIT OF STOP.

**TRANSMISSION SPEED** > **MUST BE SET AT 9600 OR 19200 BAUD.**

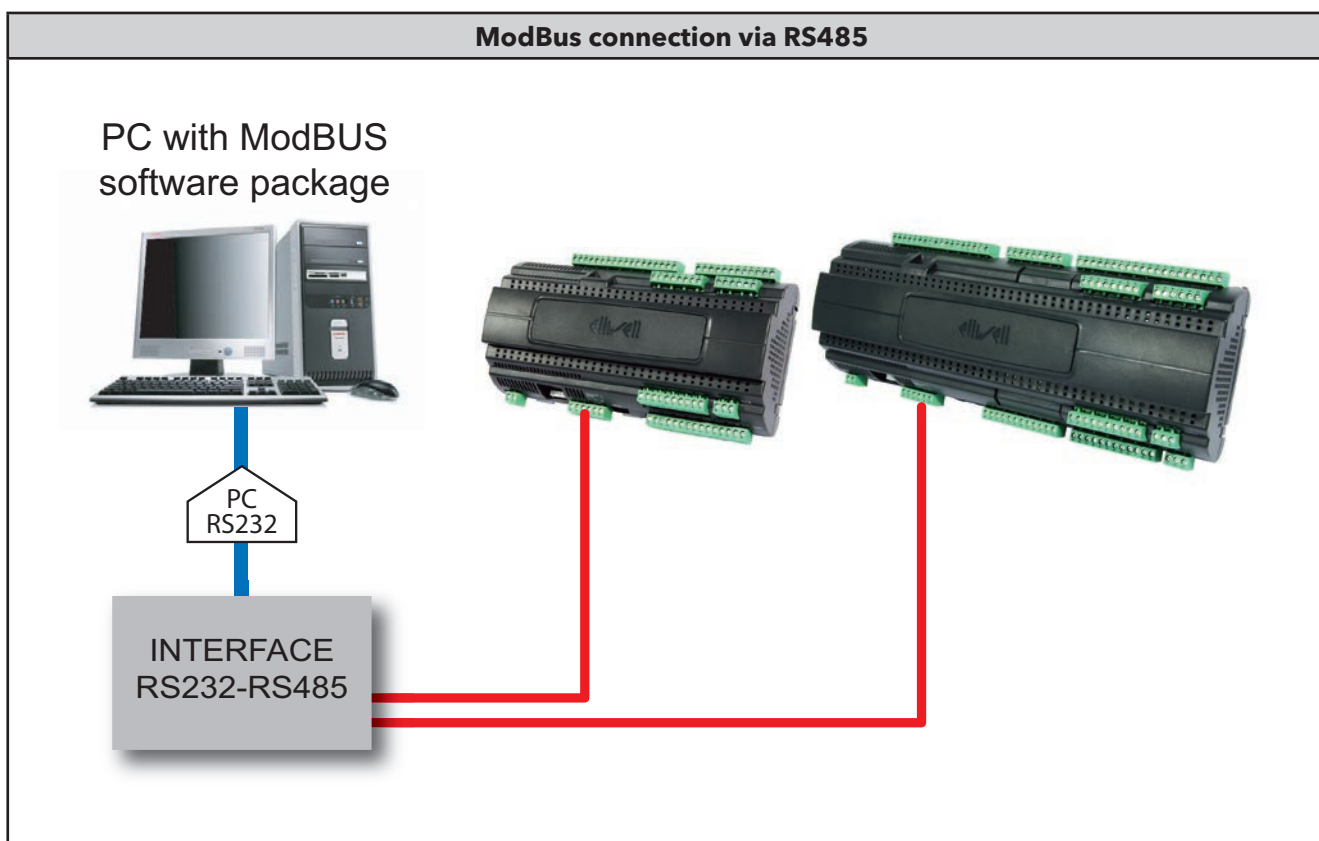

Parameter setting allows full configuration of the device

Parameters can be changed by:

- device keyboard
- USB Copy Card
- sending data via Modbus protocol directly to an individual controller, or broadcasting it, using the address 0 (broadcast)

### NETWORK

The 2 connection diagrams for using Modbus are shown below:

### 15.1.1. MODBUS COMMANDS AVAILABLE AND DATA AREAS

The following commands are implemented:

Modbus command	Description of command								
<b>03</b> (hex 0x03)	Reading 16 consecutive registers for Client side.								
<b>16</b> (hex 0x10)	Writing 15 consecutive registers for Client side								
<b>20</b> (hex 0x14)	Reading 1 register for operations and alarms history								
<b>43</b> (hex 0x2B)	Reading device ID It is possible to read the following 3 fields:								
	<table border="1"> <thead> <tr> <th>Field code</th> <th>Field description</th> </tr> </thead> <tbody> <tr> <td><b>0</b></td> <td>Manufacturer ID (=‘ELIWELL□□’) spaces □ = <b>space</b></td> </tr> <tr> <td><b>1</b></td> <td>Device model/polycarbonate ID <b>format EWCM9900: 010_0401</b> <b>format EWCM9100: 010_0402</b> <b>format EWCM8900: 010_0403</b> <b>PCH = 16 (10 hex) POLI (EWCM9900) = 1025 (0401 hex)</b> <b>PCH = 16 (10 hex) POLI (EWCM9100) = 1026 (0402 hex)</b> <b>PCH = 16 (10 hex) POLI (EWCM8900) = 1027 (0403 hex)</b></td> </tr> <tr> <td><b>2</b></td> <td>Device family (MSK 504)/version ID <b>format: 01F8_0013</b> <b>MSK = 504 (1F8 hex) REL = 19 (13 hex)</b></td> </tr> </tbody> </table>	Field code	Field description	<b>0</b>	Manufacturer ID (=‘ELIWELL□□’) spaces □ = <b>space</b>	<b>1</b>	Device model/polycarbonate ID <b>format EWCM9900: 010_0401</b> <b>format EWCM9100: 010_0402</b> <b>format EWCM8900: 010_0403</b> <b>PCH = 16 (10 hex) POLI (EWCM9900) = 1025 (0401 hex)</b> <b>PCH = 16 (10 hex) POLI (EWCM9100) = 1026 (0402 hex)</b> <b>PCH = 16 (10 hex) POLI (EWCM8900) = 1027 (0403 hex)</b>	<b>2</b>	Device family (MSK 504)/version ID <b>format: 01F8_0013</b> <b>MSK = 504 (1F8 hex) REL = 19 (13 hex)</b>
	Field code	Field description							
	<b>0</b>	Manufacturer ID (=‘ELIWELL□□’) spaces □ = <b>space</b>							
<b>1</b>	Device model/polycarbonate ID <b>format EWCM9900: 010_0401</b> <b>format EWCM9100: 010_0402</b> <b>format EWCM8900: 010_0403</b> <b>PCH = 16 (10 hex) POLI (EWCM9900) = 1025 (0401 hex)</b> <b>PCH = 16 (10 hex) POLI (EWCM9100) = 1026 (0402 hex)</b> <b>PCH = 16 (10 hex) POLI (EWCM8900) = 1027 (0403 hex)</b>								
<b>2</b>	Device family (MSK 504)/version ID <b>format: 01F8_0013</b> <b>MSK = 504 (1F8 hex) REL = 19 (13 hex)</b>								

#### Length restrictions

Maximum length in bytes of messages sent to device	30 BYTES
Maximum length in bytes of messages received by the device	30 BYTES

### 15.1.2. ADDRESS CONFIGURATION

The serial RS485 can be used to configure the device, parameters, states, and variables with Modbus via the Modbus protocol.

The address 0 is used for broadcast messages that all slaves recognise.  
Slaves don't respond to broadcast messages.

The parameters for configuring the device are:

Folder	Parameter	Description	Values
<b>ADDRESSING</b>	<b>673-PtStLV</b>	Protocol selection RS485	<b>2=</b> Micronet ( <b>Televis</b> ) <b>3= Modbus RTU</b>
<b>ADDRESSING</b>	<b>674-bdrttLV</b>	Baud rate RS485.	<b>0=</b> 9600 b/s; <b>1=</b> 19200 b/s; <b>2=</b> 38400 b/s;
<b>ADDRESSING</b>	<b>675-PtytLV</b>	Parity bit RS485.	<b>0=</b> NONE; <b>1=</b> ODD (disparity); <b>2=</b> EVEN (parity)
<b>ADDRESSING</b>	<b>676 - PtSEXP</b>	Protocol selection RS485 EXP.	<b>2=</b> Micronet ( <b>Televis</b> ) <b>3= Modbus RTU</b>
<b>ADDRESSING</b>	<b>677 - bdrEXP</b>	Baud rate RS485 EXP.	<b>0=</b> 9600; <b>1=</b> 19200; <b>2=</b> 38400 b/s;
<b>ADDRESSING</b>	<b>678 - PtyEXP</b>	Parity bit RS485 EXP	<b>0=</b> NONE; <b>1=</b> ODD (disparity); <b>2=</b> EVEN (parity)
<b>ADDRESSING</b>	<b>679 - datEXP</b>	Data bit RS485 EXP	<b>0=</b> 7 data bit; <b>1=</b> 8 data bit;

**NOTE:** To guarantee correct operation, the controller must be switched off and switched on again after modification of parameters

**IMPORTANT:** Remember to set **2 stop BIT**.

### 15.1.3. PASSWORDS AND STRINGS

To read and write strings there are 3 cases

**5 character strings > 3 WORDS**

**10 character strings > 5 WORDS**

**20 character strings > 10 WORDS**

#### **PASSWORD > 5 character strings**

With a 5 character string (for passwords) you read 3 **WORDS** where the last byte is 'discarded' - see the example

password **abcde**

1st WORD		2nd WORD		3rd WORD	
MSB BYTE	LSD BYTE	BYTES	BYTES	BYTES	BYTES
a	b	c	d	e	∅

∅ = value to be discarded

#### **reading/writing PASSWORD > 5 character string**

Reading/writing password **PSW1 = +\*\*\*\* register 1**

1st WORD		2nd WORD		3rd WORD	
BYTES	BYTES	BYTES	BYTES	BYTES	BYTES
+	*	*	*	*	∅
0x2B	0x2A	0x2A	0x2A	0x2A	0x00

∅ = value to be discarded

#### **writing register 1 command 16 (0x10)**

**writing command > ADR 10 00 01 00 03 06 2B 2A 2A 2A 2A 00**

**response > 01 10 00 01 00 03 CRC CRC**

#### **reading register 1 command 03 (0x03)**

**reading command > ADR 03 00 01 00 03**

**response > 01 03 06 2B 2A 2A 2A 2A 00 CRC CRC**

**ADR: EWCM address**

**CRC: checksum**

### reading/writing PASSWORD > 5 character string

Reading/writing password **PSW1 = QQ** □□□

QQ followed by 3 spaces □ + ∅ = value to be discarded

1st WORD		2nd WORD		3rd WORD	
BYTES	BYTES	BYTES	BYTES	BYTES	BYTES
<b>Q</b>	<b>Q</b>	□	□	□	∅
<b>0x51</b>	<b>0x51</b>	<b>0x20</b>	<b>0x20</b>	<b>0x20</b>	<b>0x00</b>

### DATA FILE >20 character string

String with 19 characters '**HW:□CRC□1.0**□□□□□□□'

spaces = □

The character no. 20 is discarded as 'null': the useless part is placed as 0

BYTES 1							BYTES 8							BYTES 15				BYTES 19	BYTES 20
<b>H</b>	<b>W</b>	<b>:</b>	□	□	□	<b>C</b>	<b>R</b>	<b>C</b>	□	<b>1</b>	<b>.</b>	<b>0</b>	□	□	□	□	□	□	<b>-</b>
<b>0x48</b>	<b>0x57</b>	<b>0x3A</b>	<b>0x20</b>	<b>0x20</b>	<b>0x20</b>	<b>0x43</b>	<b>0x52</b>	<b>0x43</b>	<b>0x20</b>	<b>0x31</b>	<b>0x2E</b>	<b>0x30</b>	<b>0x20</b>	<b>0x20</b>	<b>0x20</b>	<b>0x20</b>	<b>0x20</b>	<b>0x20</b>	<b>0x00</b>

### DATA FILE >20 character string

String with 20 characters '**EMPTY**'

BYTES 1							BYTES 8							BYTES 15				BYTES 19	BYTES 20
-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>	<b>0x00</b>

## 15.2. MODBUS TABLES

The tables below list all information required to read, write and decode all accessible resources in the device.

There are 2 tables:

- > **'PARAMETERS TABLE'** includes all configuration parameters for the device memorised in the non-volatile memory of the device
- > **'CLIENT TABLE'** includes all resources of IO and alarm status available in the device's volatile memory.

**Description of columns:**

### FOLDER

This indicates the label of the folder containing the parameter in question.

### LABEL

This indicates the label used to display the parameters in the menu of the device.

### PAR. VALUE ADDRESS

The whole part represents the address of the MODBUS register containing the value of the resource to be read or written in the device. The value after the point indicates the position of the most significant data bit inside the register; if not indicated it is taken to be zero. This information is always provided when the register contains more than one information item, and it is necessary to distinguish which bits actually represent the data (the working size of the data indicated in the column DATA SIZE is also taken into consideration).

Given that the modbus registers have the size of one WORD (16 bit), the index number after the point can vary from 0 (least significant bit -LSb-) to 15 (most significant bit -MSb-).

Examples (in binary form the least significant bit is the first on the right):

PAR. VALUE ADDRESS	DATA SIZE	Value		Content of register
8806	WORD	1350	1350	(0000010101000110)
8806	BYTES	70	1350	(00000101 <b>01000110</b> )
8806.8	BYTES	5	1350	( <b>00000101</b> 01000110)
8806.14	1 BIT	0	1350	(0000010101000110)
8806.7	4 BIT	10	1350	(00000 <b>1010</b> 1000110)

**IMPORTANTE:** when the register contains more than one piece of data, the write procedure is as follows:

- read current value of register
- modify bits for the resource concerned
- write register

### R/W

Indicates if resources are read/write, read-only or write-only:

- R** the resource is read-only
- W** the resource is write-only
- RW** the resource is both read and write

### DESCRIPTION

is the description of parameters in the **LABEL** column.

### DATA SIZE

Indicates the size of data in bits

All data are in **WORDS**

Strings and passwords are **multiple** registers: however addresses remain **consecutive**

### CPL

When the field indicates '**Y**', the value read by the register needs to be converted because the value is a number with a sign.

In other cases the value is always positive or null.

To carry out the conversion, proceed as follows:

- If the value in the register is between 0 and 32.767, the result is the value itself (zero and positive values)
- If the value in the register is between 32.768 and 65.535, the result is the value of the register - 65.536 (negative values)

### RANGE

Describes the interval of values that can be assigned to the parameter. It can be correlated with other device parameters (indicated in the parameter label).

### M.U.

Unit of measurement for values converted based on rules indicated in columns **CPL** and **EXP**.

## 15.2.1. PARAMETERS TABLE

EWCM EO foresees a group of parameters representing the same variable in different units of measurement. Parameters are duplicated / quadrupled depending on the Unit of Measurement shown on the display. For example, the parameter for the 141 - LSE Compressors minimum setpoint folder is quadrupled as:

- 141 - LSE - **1** minimum setpoint °C
- 141 - LSE - **2** minimum setpoint °F
- 141 - LSE - **3** minimum setpoint bar
- 141 - LSE - **4** minimum setpoint PSI

In the following parameter table, the parameter is repeated 4 times in 4 different lines with suffix - 1,...-4.

**NOTE:** Modbus Reading Command: **03 (0x03)** and Modbus Writing command: **16 (0x10)**

FOLDER	LABEL	Value PAR. ADDRESS	R/W	DESCRIPTION	DATA SIZE	CPL	RANGE	EXP	M.U.

## 16. WARNINGS

### 16.1. ELECTRICAL CONNECTIONS

**Important! Make sure the appliance is switched off before working on the electrical connections.**

The device is equipped with removable screw terminals to connect wires having a maximum cross section of 2.5 mm<sup>2</sup> (a single conductor per terminal for power feed connections): please refer to the label on the device for details on terminal ratings. Do not exceed the maximum permitted current; for higher loads, use a contactor with sufficient power capacity. Make certain the power supply voltage matches the rated voltage of the device.

Probes have no connection polarity and can be extended using a normal two-core cable (note that extension of probe leads influences the instrument's electromagnetic compatibility - EMC: take great care with the wiring). Probe cables, power supply cables and the TTL serial cables should be routed separately from power cables.

### 16.2. DISCLAIMER

This document is the exclusive property of ELIWELL CONTROLS SRL and may not be reproduced or circulated without the express permission of ELIWELL CONTROLS SRL.

While all possible care has been taken to ensure the accuracy of this document, ELIWELL CONTROLS SRL cannot accept liability for any damage resulting from its use. The same applies to any person or company involved in preparing and editing this document. ELIWELL CONTROLS SRL reserves the right to make aesthetic or functional changes at any time without notice.

### 16.3. LIABILITY AND RESIDUAL RISKS

ELIWELL CONTROLS SRL declines any liability for damage due to:

- installation/use other than expressly specified and, in particular, in conflict with the safety prescriptions set down in regulations and/or specified herein;
- use on panels that do not provide adequate protection against electric shocks, water or dust when assembled.
- use on panels allowing access to dangerous parts without having to use tools;
- tampering with and/or modification of the product;
- installation/use on panels that do not comply with statutory laws and regulations.

### 16.4. CONDITIONS OF USE

#### Permitted use

For safety reasons, the device must be installed and used in accordance with the instructions provided. In particular, parts carrying dangerous voltages must not be accessible under normal conditions. The device must be adequately protected from water and dust with regard to the application, and must only be accessible using tools (with the exception of the front panel). The device is suitable for use in household refrigeration appliances and/or similar equipment and has been tested for safety aspects in accordance with the harmonized European reference standards.

#### Prohibited use

Any use other than what is expressly permitted is prohibited. The relay contacts provided are mechanical and subject to failure. Any protection devices required by product standards, or suggested by good practice in view of obvious safety requirements, must be installed outside the device.

### 16.5. DISPOSAL

The appliance (or the product) must be disposed of separately in compliance with the local standards in force on waste disposal.

17.1. SERVICE MENU

ACCESS TO SERVICE MENU

	<table border="1"> <tr> <td data-bbox="751 461 1129 595"> <b>MENU</b> 01/02                  Diagnostics  <b>Service</b>                  Clock and bands             </td> </tr> </table>		<b>MENU</b> 01/02 Diagnostics <b>Service</b> Clock and bands

<b>SERVICE</b> 03/04 EEV Save User Setting <b>Service Password</b>			
<b>SERV. PSW</b> 001/001 637 - PSW4 Password 4. *****			

## Recordings

Menu composed of 2 folders:

- Upload to Copy Card: allows 'uploading' the operation recordings history to Copy Card - see USB Copy Card chapter.
- Reset Recordings: cancels (resets) all recordings - operation recordings history. Confirmation of deletion will be requested (**Confirm Del.**). Confirm with OK/DX (right); to exit press SX (left).

## Utilities status

Displays status of compressors and fans

### RESET > CANCELLATION (Res) hours of operation

Move onto the selected utility with the UP and DOWN keys and confirm resetting with the OK / DX (right) key.

<b>SERVI</b> 01/03 Recordings <b>Utilities state</b> Reset Alarm History	<b>SERV. PSW</b> 001/001 637 - PSW4 Password 4. *****
<b>UTILI</b> 01/01 <b>Compressors</b> Fans	<b>UTILI</b> 01/01 Compressors <b>Fans</b>
<b>COMPR</b> 01/03 Res Comp1 0 hours Res Comp2 30 hours Res Comp3 26 hours	<b>FANS</b> 01/01 Reset Fan1 2 hours Reset Fan2 20 hours Reset Fan3 18 hours

### SELECT/DESELECT each single compressor

See INVERTER Error Alarms section

**Sel Comp1 → YES compressor selected**

**Sel Comp2 → NO compressor deselected**

**Sel CInv1 → YES compressor INVERTER selected**

<b>COMPR</b> 01/03 Sel Comp1 Yes Sel Comp2 No Sel Comp3 Yes	<b>COMPR</b> 03/03 CInv1 Sel Yes
--	-------------------------------------

Compressors can be selected (**Yes**) or deselected (**No**) singly.

Deselecting a compressor resets the compressor alarms which will not be controlled, and its 'availability' within the system.

It is possible to reset times of digital compressors and of the continuous compressor.

## INVERTER SUCTION ERROR

EWCM EO manages compressor behaviour with an INVERTER error through configuration of Quick Start parameters **522 - Cpty** and **524 - Cpty2** with the following settings

**CIRCUIT 1** → **522 - Cpty = 3** that is managing homogeneous + INVERTER steps, in an INVERTER error

**CIRCUIT 2** → **524 - Cpty2 = 3** that is managing homogeneous + INVERTER steps, in an INVERTER error

## REGULATION OF SUCTION WITH **BACKUP** INVERTER

In these cases control is automatically switched to digital compressors.

The Alarm appears in the Alarms Menu

In the Service Menu the display of operating times and selection of the compressor INVERTER will automatically switch to a digital output.

normal operations		INVERTER suction error	
<b>COMPR</b> 01/03 Res Comp1 0 hours Res Comp2 30 hours Res Clnv 2 hours		<b>COMPR</b> 01/03 Res Comp1 0 hours Res Comp2 30 hours <b>Res Comp3 2 hours</b>	
<b>COMPR</b> 01/03 Sel Comp1 Yes Sel Comp2 Yes Sel Clnv Yes		<b>COMPR</b> 01/03 Sel Comp1 Yes Sel Comp2 Yes <b>Sel Comp3 Yes</b>	

The compressor INVERTER is switched to digital 3 output

Note that compressor INVERTER usage times will be the same as those of the corresponding digital compressor:

While operating in backup the continuous compressor digital input block is used to block digital compressor 3 which is really the compressor connected to the inverter piloted digitally.

### INVERTER DISCHARGE ERROR

EWCM EO manages compressor behaviour with an INVERTER error through the Quick Start parameter **520 - Fnty** with the following settings

**520 - Fnty = 3** that is control through INVERTER, with an INVERTER error

**520 - Fnty = 5** that is control through digital + INVERTER, with an INVERTER error

## REGULATION OF DISCHARGE WITH **BACKUP** INVERTER

In these cases control is automatically switched to digital fans.

The Alarm appears in the Alarms Menu

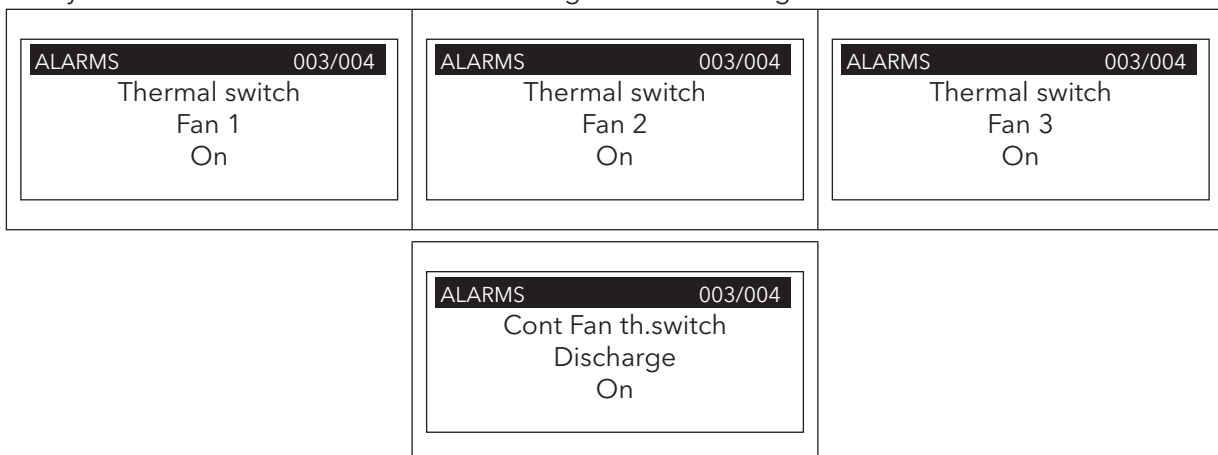

In the Service Menu both the display of the operating times and the selection of the fan INVERTER will automatically switch to a digital output. (example with 3 fans in parallel)

normal operations	INVERTER discharge error
<div style="border: 1px solid black; padding: 5px;"> <p style="text-align: center;"><b>FANS</b>    01/01</p> <p>Res InvFan    29 hours</p> </div>	<div style="border: 1px solid black; padding: 5px;"> <p style="text-align: center;"><b>FANS</b>    01/01</p> <p>Reset Fan1    29 hours            Reset Fan2    29 hours            Reset Fan3    29 hours</p> </div>

While operating in backup all digital fan thermal switches are activated  
 If the continuous fan thermal switch is activated during backup operations (inverter error ventilation on) nothing happens except it being displayed.

This alarm only blocks ventilation if the inverter discharge error is no longer on.

### Reset Alarm History

Menu to clear (reset) the alarm history.  
 Confirmation of deletion will be requested (**Confirm Del.**).  
 Confirm with OK/DX (right); to exit press SX (left).

### Copy Card

See USB Copy Card chapter

### IO Test

Manual management (**test**) of outputs present  
 To test the outputs it is necessary to enable manual mode:  
 access the Manual Mode Menu by pressing OK, press the DX (right) key and press UP to change from No to Yes.  
 Exit the Menu with the SX (left) key.

<table border="1"> <tr> <td><b>SERVI</b></td> <td>02/03</td> </tr> <tr> <td>Copy Card</td> <td></td> </tr> <tr> <td><b>IO Test</b></td> <td></td> </tr> <tr> <td>IO State</td> <td></td> </tr> </table>	<b>SERVI</b>	02/03	Copy Card		<b>IO Test</b>		IO State		<table border="1"> <tr> <td><b>IO TE</b></td> <td>01/01</td> </tr> <tr> <td><b>Manual</b></td> <td><b>YES</b></td> </tr> <tr> <td>Outx Test</td> <td></td> </tr> <tr> <td>Vx/lx Test</td> <td></td> </tr> </table>	<b>IO TE</b>	01/01	<b>Manual</b>	<b>YES</b>	Outx Test		Vx/lx Test

Vx/lx																	
Dlx/DIHx																	
	<table border="1"> <tr> <td><b>IO ST</b></td> <td>02/02</td> </tr> <tr> <td>Outx</td> <td></td> </tr> </table>	<b>IO ST</b>	02/02	Outx													
<b>IO ST</b>	02/02																
Outx																	

**PBx >** values read by analogue inputs

**Vx/lx >** values read by analogue outputs

**Dlx/DIHx >** values read by digital inputs **OFF** or **ON**

**Outx >** values read of digital outputs **OFF** or **ON**

### 17.1.1. EEV

If

**EXTERNAL DRIVER > 740 - EEvE = 1 →step1 / 740 - EEvE = 2 →CO2**

the Service Menu displays the **EEV** folder

SERVICE 01/03	SERVICE 02/03	SERVICE 03/03	<b>SERVICE</b> 
Recordings Utilities state Reset Alarm History	Copy Card IO Test IO State	<b>EEV</b> Service Password FW: 504_01 03/08/12	

#### SERVICE PASSWORD

If the electronic expansion valve is present, you can monitor valve driver 'status' through the Service menu (read only)

EEV 01/02	EEV 02/02	<b>EEV SERVICE</b> 
On/Off Off Alarm Off Out % 100.0%	SHT 0.0 °C Disch. Pres 0.0 Bar Comm. Err. On	

**On/Off:** display of EEV driver status.

**Alarm:** display of EEV driver alarm status.

The alarm does not block the EWCM EO resources if used for sub-cooling (generic regulator, step1),  
The alarm blocks EWCM EO resources with the CO2 condenser. The alarm is always automatic.

**Out %:** Valve opening percentage.

**SHT:** Valve overheating temperature.

**Disch. Pres:** Pressure the driver uses to regulate high pressure. In nominal conditions it is a probe configured on the driver read by the EWCM. With a probe error or not configured the value is written on the driver by the EWCM.

**Comm. Err:** Communication error with the EEV driver.

## 17.1.2. USER SETTINGS

In Service menu a folder **Save User Setting** is available

<p>SERVICE 01/04</p> <p><b>Recordings</b></p> <p>Utilities state Reset Alarm History</p>	<p>SERVICE 02/04</p> <p><b>Copy Card</b></p> <p>IO Test IO State</p>	<p>SERVICE 03/04</p> <p>EEV</p> <p><b>User Setting</b></p> <p>Service Password</p>	<p>SERVICE</p> 
--	--	--	--

### User Settings

The customer, once assisted configuration is complete, I/O configured and the regulation parameters set, can save the machine status in order to restore the settings as necessary.

	<p>USER SET. 01/01</p> <p>Save User Setting Load User Setting</p>		<p>SERVICE</p> 
--	---	--	--

To 'freeze' the current machine status, access Save User Setting, navigate to Upload and press OK.

	<p>SAVE USER SET. 01/01</p> <p>Operation state: &lt; Operation state &gt;</p> <p>Upload</p>		<p>SERVICE</p> 
--	---	--	--

The message that will appear will be:

#### <Operation state>

The state of the operation can be:

- No operation
  - Operation in progress (°)
  - Operation Terminated (operation terminated successfully).
- (°) N.B! wait: it can take a few minutes.

If necessary (if memory error detected), EWCM EO will automatically reset the machine with the default settings. User can save the current default settings (user setting) manually (menu service) or automatically when a parameter is changed (1 h after the modification all the user setting will be overwritten). The default setting is initialized per default at the factory settings.

Conversely, to 'restore' machine status manually with the customised user settings (access **Load User Setting**, navigate to Download and press OK.

	<p>LOAD USER SET. 01/01</p> <p>Operation state: &lt; Operation state &gt;</p> <p>Download</p>		<p>SERVICE</p> 
--	---	--	--

**PLEASE NOTE THAT THE SERVICE MENU IS FOR USE BY AUTHORISED  
PERSONNEL ONLY.  
THE MENU IS PASSWORD PROTECTED.  
THE MENU ALLOWS SYSTEM MAINTENANCE AND ENABLES RESOURCES  
AND LOADS TO BE REMOVED AND ADDED.**

**THE LAST MENU ITEM INDICATES THE FIRMWARE VERSION OF THE  
INSTRUMENT AND CORRESPONDING DATE.**

**EXAMPLE FW: 504.09 02/09/13**

**PLEASE PROVIDE THIS INFORMATION WHEN CONTACTING  
TECHNICAL SUPPORT**

## 18.1. INTRODUCTION

This section illustrates the various applications and examples of systems managed by EWCM EO and the relative programs (.dat) supplied by Eliwell available in the website [www.eliwell.com](http://www.eliwell.com)

Examples referred to model EWCM 9900 EO (18DIN) with default settings  
 Inputs and outputs maintain compatibility with models EWCM 9900 and EWCM 9100 EO (13 DIN)  
 Applications do not modify regulation limits, alarms and safety times.  
 Some settings given as examples could require the specific application to be adapted.

## 18.2. PROGRAMS AND APPLICATIONS

File names .dat contain maximum 8 upper case characters

Programs	Description	Application	DAT
<b>Program 1</b>	EWCM EO + 1 x V910 via I/O	<b>CO2</b>	<b>9900AB01</b>
<b>Program 2</b>	EWCM EO + 1 x V910 via serial port RS485		<b>9900AB02</b>
<b>Program 3 LT</b>	EWCM high synchronisation		<b>99BTAB03</b>
<b>Program 3 MT</b>	EWCM low synchronisation		<b>99TNAB03</b>
<b>Program 4</b>	EWCM EO + Gas cooler		<b>9900AB04</b>

<b>Program 12</b>	EWCM EO floating condensation at set points	<b>condensation floating set points</b>	<b>9900AB12</b>
<b>Program 13</b>	EWCM EO configurable regulator ON/OFF at a COOL mode activation point management of warning and maximum alarm limit	<b>configurable regulator</b>	<b>9900AB13</b>
<b>Program 14</b>	EWCM EO configurable regulator ON/OFF with two activation points		<b>9900AB14</b>
<b>Program 15</b>	EWCM EO + V800 via I/O fixed temperature sub-cooling	<b>sub-cooling</b>	<b>9900AB15</b>
<b>Program 16</b>	EWCM EO + V910 via serial port RS485 floating temperature sub-cooling		<b>9900AB16</b>

**The map must be downloaded with USB Copy Card<sup>[1]</sup>**

**Having downloaded the map from USB to EWCM EO extract USB Copy Card and EWCM EO resets automatically**

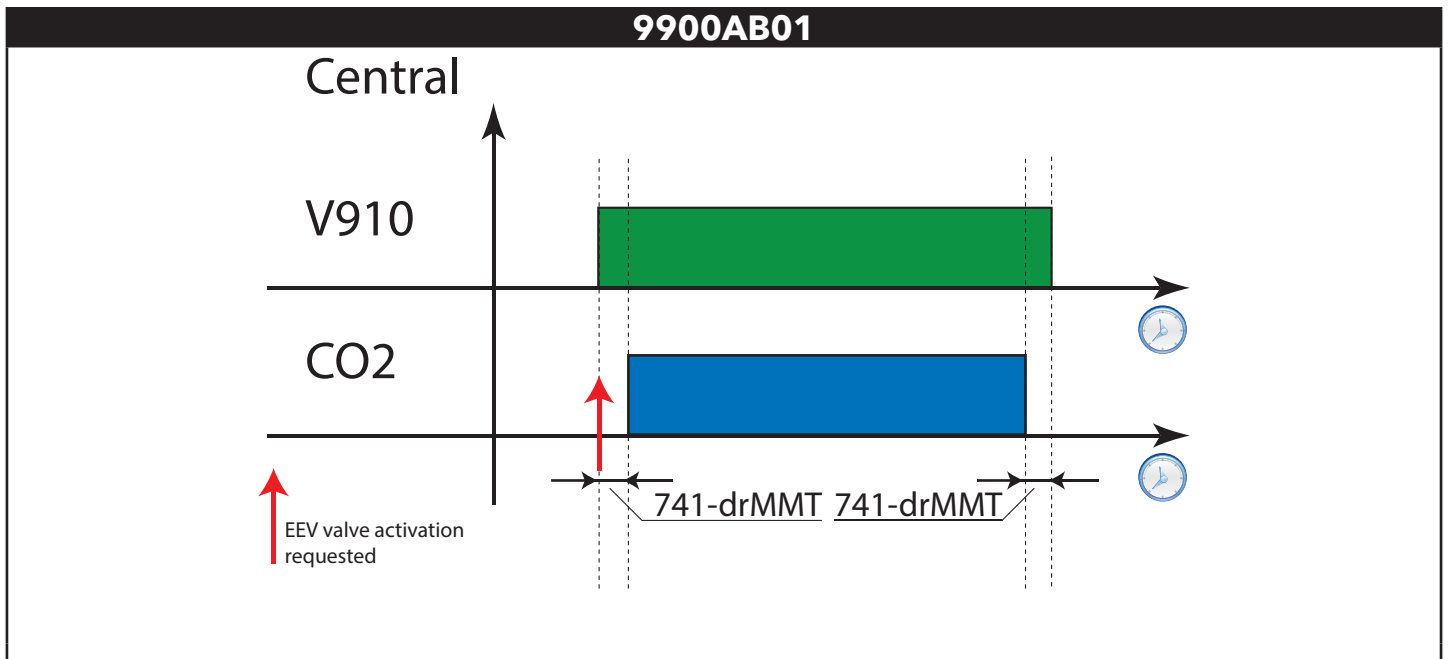

<sup>1</sup> See '7.1. usb copy card' page 41

### 18.2.1. PROGRAM 1 - 9900AB01 EWCM + V910 DIGITAL COMMANDS

EWCM EO manages an EEV driver for intermediate exchanger, through a digital output (command) and a digital input (block).

In this way it can command a V910 or third party driver.

Folder	Parameter	Description	LT	DAT
EXTERNAL DRIVER	740 - EEvE	Enable electronic valve driver	2	
EXTERNAL DRIVER	741 - drMMT	Delay activation high temperature central (MT) at minimum power	0 ... 999"	
RESOURCE ALLOCATION Digital Outputs	584-H201 ÷ 602-H219	control EEV activation from LP plant	±98	OUT13
RESOURCE ALLOCATION Digital Inputs	603-H101 ÷ 622-H306	General alarm	±1	DIL4

## Notes

No relay must be configured with values 96 and 97: **584-H201 ÷ 602-H219 ≠ 96 and 97**

Settings necessary on **V910**:

At least one digital input **ddl1 or ddl2 = +/- 1 (On)**:

Parameter	Description	Value	Notes
dL40	Configuration of digital input ddl1	= 1 (on)	<ul style="list-style-type: none"> <li>• 0 = digital input not configured</li> <li>• ±1 = ON/OFF regulation</li> <li>• ±2 = defrost</li> <li>• ±3 = alarm</li> <li>• ±4 = system operating mode (only modes 0 and 1)</li> </ul>
dL41	Configuration of digital input ddl2		

At least one digital output **ddO1 / ddO2 = +/- 2 (Alarm)**:

Parameter	Description	Value	Notes
dL90	digital output configuration ddO1	= 2 (AL)	<ul style="list-style-type: none"> <li>0 = output controlled from serial</li> <li>±1 = solenoid valve control</li> <li>±2 = alarm output</li> </ul>
dL91	digital output configuration ddO2 (Open collector)		

Type of regulation **dF02=0** from digital input

Parameter	Description	Value	Notes
dF02	Selection of type of valve regulator activation	= 0 (digital input)	<ul style="list-style-type: none"> <li>0= digital input</li> <li>1= Serial</li> <li>2= reg. ON/OFF</li> <li>3= EWCM</li> </ul>

## 18.2.2. PROGRAM 2 -9900AB02 EWCM EO + V910 - COMMAND BY SERIAL PORT RS485 EXP

The EWCM system controller is equipped with a second serial port (RS485 EXP) which can be used to control the V910 directly. In this way you can have the operation status in the menu (of the EWCM) and the more important V910 sizes.

Folder	Parameter	Description	LT	DAT
EXTERNAL DRIVER	740 - EEvE	Enable electronic valve driver	2	
EXTERNAL DRIVER	741 - drMMT	Delay activation high temperature central (MT) at minimum power	0 ... 999"	

**N.B.:**

No relay must be configured with values 96, 97, 98: **584-H201 ÷ 602-H219 ≠ 96, 97, 98**

Settings necessary on **V910**:

Parameter	Description	Value	Notes
dF02	Selection of type of valve regulator activation	= 3 (EWCM)	0= digital input 1= Serial 2= reg. ON/OFF 3= EWCM

**Addressing and Protocol  
Modbus RTU 18200 baud, and 1**

Parameter	Description	Value	Notes
dF00	COM0 protocol selection	= 1	0= Micronet (Televis) 1= <b>Modbus RTU</b> 2= NOT USED 3= NOT USED
dF30	Modbus protocol controller address	= 1	values from 1 to 255
dF31	Modbus protocol controller baud rate	= 4 (19200)	0= 1200 baud 1= 2400 baud 2= 4800 baud 3= 9600 baud 4= <b>19200</b> baud 5= 38400 baud 6= 57600 baud 7= 115200 baud
dF32	Modbus protocol controller parity	=1 (EVEN)	0= NONE; 1= <b>EVEN</b> (parity) 2= ODD (disparity)

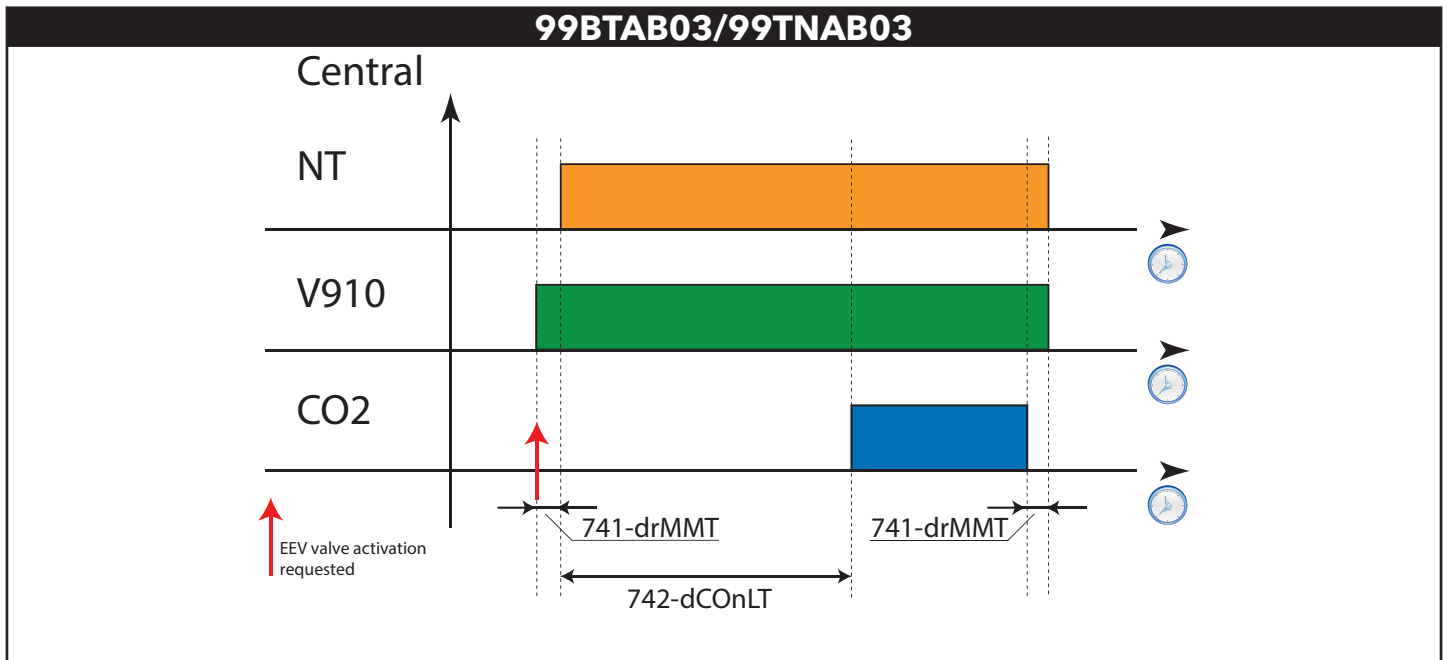

### 18.2.3. PROGRAM 3 - 99TNAB03 / 99BTAB03 HIGH AND LOW TEMPERATURE EWCM PLANT SYNCHRONISATION

MT DAT plant: 99TNAB03

LT DAT plant: 99BTAB03

By synchronising two EWCM EO (high and low temperature plants) discharge pressure stability of LT side can be improved. This occurs as the low temperature plant only activates its compressors after the high temp. plant has been on for a certain time. If the high temperature plant is not on, synchronisation forces the high temperature plant to operate at minimum.

Folder	Parameter	Description	MT	LT	DAT
EXTERNAL DRIVER	740 - EEvE	Enable electronic valve driver		2

### 18.2.4. PROGRAM 4 - 9900AB04 EWCM WITH GAS COOLER

Use of a gas cooler, placed between the compressor CO2 circuit outlet and the intermediate exchanger, allows for initial cooling of gas using external air.

The gas cooler can have one (or more) fans controlled by EWCM EO (LT side) directly.

Maximum efficiency is obtained by modulating gas cooler fans based on external temperature (floating condensation).

## 9900AB04

## 18.2.5. PROGRAM 5 -9900AB05 EWCM WITH DOUBLE INTERMEDIATE EXCHANGER

Use of two intermediate exchangers of equal power in parallel (with a capacity of at least 60-70% maximum capacity required) allows:

**redundancy:** reduction of machine stops due to breakdowns

**greater power:** the system increases cooling power by the simple increase (at a later moment) of compressors.

Each V910 driver has its own activation relay to maintain electric insulation between them.

The drivers' alarm relays are placed in serial: when both V910 drivers block EWCM EO stops.

## 18.2.10. PROGRAM 10 - 9900AB10 EWCM SINGLE CIRCUIT WITH COMPRESSORS ON/OFF AND INVERTER CONDENSATION WITH INVERTER

Single circuit control with 3 full compressors and inverter, PI regulation (derivative component disabled). Condensation control with fan inverters and proportional regulation with lateral set point compared to band. Fan switch on and switch off cut off is disabled. All compressors have the same rated power.

- Line frequency 50Hz
- Min inverter frequency: 30Hz
- Inverter switch-on frequency: 30Hz
- Max inverter frequency: 60Hz

## 18.2.11. PROGRAM 11 - 9900AB11 EWCM DOUBLE CIRCUIT WITH COMPRESSORS ON/OFF AND INVERTER CONDENSATION WITH INVERTER

**NOTE: Only valid for EWCM 9900 EO**

Control of 2 circuits with full compressors and inverter, PI regulation (derivative component disabled).

- **LT:** 3 full compressors + inverter
- **MT:** 2 full compressors + inverter

Condensation control with fan inverters and proportional regulation with lateral set point compared to band. Fan switch on and switch off cut off is disabled. All compressors have the same rated power.

- Line frequency 50Hz
- Min inverter frequency: 30Hz
- Inverter switch-on frequency: 30Hz
- Max inverter frequency: 60Hz

## 18.2.12. PROGRAMMA 12 - 9900AB12 EWCM CONDENSATION AT FLOATING SETPOINT

Floating setpoint condensation based on external temperature.  
Discharge gas sub-cooling control not enabled.

Make sure the discharge economy function is on through one of the options available:

1. time band programmed;
2. dedicated digital input for the function in question;
3. key;
4. functions menu;
5. remote control (supervision system or Web);
6. 'Energy Saving' function;

Please note that the dynamic set point is limited downwards by parameter **359 - LdSP** and upwards by:

**343-SEt + 349-dSFo**

In the example **349-dSFo = 0** the upper limit is parameter **343-SEt** (Discharge set point).

Folder	Parameter	Description	MT	DAT
FANS Regulation/Alarms	314 - dSd	Dynamic discharge set mode	0	
FANS Regulation limits	358-dSMEt	Max external temp. dynamic set	28.0	
FANS Regulation limits	356-dSdo	Dynamic offset dynamic set	10.0	
FANS Regulation limits	357 - dSLdo	Minimum dynamic offset dynamic set	6.0	
FANS Regulation limits	349 - dSFo	Fixed offset dynamic set (max dynamic set = 349 - dSFo + 343-SEt)	0.0	
FANS Regulation limits	359 - LdSP	Minimum dynamic set	25.0	
RESOURCE ALLOCATION Digital Inputs	630-H408	External ambient temperature	5	PB8

To disable sub-cooling control just make sure the relative temperature probe is not allocated:  
make sure that none of the parameters from 627-H405 to 630-H408 is configured with 6.

### 18.2.13. PROGRAM 13 - 9900AB13 EWCM CONFIGURABLE REGULATOR ON/OFF

Alarms have two intervention limits, a 'warning' (signal) and the alarm itself both configurable  
 The warning can be enabled or not through **724-ECFAw** (0=Disabled; 1=Enabled)  
 The minimum or maximum alarm is configurable through **725-CFA<sub>ty</sub>** **0**=Minimum; **1**=Maximum

Folder	Parameter	Description	MT	DAT

## 18.2.15. PROGRAM 15 - 9900AB15 EWCM + V800 COMMAND FROM DIGITAL SUB-COOLING AT FIXED TEMPERATURE

The regulator regulates gas temperature output from sub-cooling exchanger.

EWCM EO manages an EEV driver for intermediate exchanger, through a digital output (command) ON/OFF and a digital input (block).

In this way it can command a V800 or third party driver.

**713-SEtCFR1** is referred to condensation set point > 35 °C

Folder	Parameter	Description	MT	DAT
<b>GENERAL REGULATOR</b>	<b>710-MPCFR</b>	Configurable regulator probe mode	1	
	<b>711-MCFr1</b>	Configurable regulator mode step 1	0 (COOL)	
	<b>713-SEtCFR1</b>	Configurable regulator setpoint step 1	30.0 °C	
	<b>715-dCFr1</b>	Configurable regulator delta step 1	2.0 °C	
	<b>719-CFr1dly</b>	Configurable regulator delay step 1	0	
	<b>724-ECFAw</b>	Enable warning configurable alarm	0

<b>RESOURCE ALLOCATION Digital Outputs</b>	<b>596-H213</b>	General regulator digital output step 1	94	OUT13

**N.B.:** Settings necessary on **V800**:

Parameter	Description	Value	Notes
H11	Configurability and polarity digital input DI1	1 = (ON/OFF)	0 = disabled; ±1 = ON/OFF driver; ± 2 = Defrost; ±3 = Alarm.
H12	Configurability and polarity digital input DI2	1 = (ON/OFF)	
H30	Control from digital inputs or serial	= di (Digital Input)	di = digital input (Stand-Alone mode only); LAn = LAn Eliwell; rEt= remote

## 18.2.16. PROGRAM 16 - 9900AB16

### EWCM + V910 COMMAND FROM RS485 EXPSUB-COOLING AT FLOATING TEMPERATURE

The regulator regulates temperature difference of gas output to sub-cooling exchanger.

The EWCM system controller is equipped with a second serial port (RS485 EXP) which can be used to control the V910 directly. In this way you can have the operation status in the menu (of the EWCM) and the more important V910 sizes. The regulator regulates on difference between discharge pressure temperature and gas temperature output from sub-cooling exchanger.

Folder	Parameter	Description	MT	DAT
<b>GENERAL REGULATOR</b>	<b>710-MPCFR</b>	Configurable regulator probe mode	2	
	<b>711-MCFr1</b>	Configurable regulator mode step 1	1 (HEAT)
